

QCTS

Government Owned IUID Tools

Applied Enterprise Solutions

Problem

- The DoD IUID mandates are **approaching fast**.
- Project managers need tools to mark, register, and **ensure compliance**.
- Resources not available to **overhaul or replace** existing AISs.

QCTS:

The Quick Compliance Tool Suite

- A suite of government **owned** tools that **simplify** and **expedite** legacy item marking.
- The tools are **web based**.
- QCTS is compatible with existing hardware and doesn't require **rewriting existing software**.

Problem:
How do I determine if an
item is **registered**?

Problem:
How do I know that the IUID
Data Matrix is **valid**?

- e. If the AI is "95" (ASCII 57) length is greater than 30 then the string is checked for "Invalid Number/SC" and the string is checked for "Invalid Number/SC".

Format Code 5, Construct 1 Validity

- a. If the AI is "8002" (ASCII 50) and:
 - 1. If the data string is 11 characters long:
 - a. If the first 3 characters in the range "001" through "009" tested has failed for **Manufacturer Code**.
 - b. If the data string is not numeric (ASCII 48 - 57) then the string is checked for **Invalid UID**.
 - 2. If the data string is 8 characters long:
 - a. If the first 2 characters are "FF" then the string is checked for **Invalid UID - 1**.
 - b. If the data string is not numeric (ASCII 48 - 57) then the string is checked for **Hexadecimal**.
 - 3. If the data string is longer than 8 characters then the string is checked fails for **Invalid UID - 2**.
 - 4. If the data string is shorter than 8 characters then the string is checked fails for **Invalid UID - 3**.
- Note: ANSI MH10.4-1986 ESN as n4+an...20**
- b. If the AI is "8003" (ASCII 51) and:

Page

alphabetic characters plus a space, and the string is checked for each segment. The remainder of the string is checked for "Invalid UID".

Text Element Identifier Validity

- a. For all TEIs the data string is checked for English alphabet characters, numeric characters 0 through 9, special characters (ASCII 32), and the special characters (ASCII 47).
 - 1. If the data string is longer than 30 characters, the string is checked for **Invalid GS1 US Code**.
 - 2. If the data string is shorter than 30 characters, the string is checked for **Invalid GS1 US Code**.
 - 3. If the data string is not numeric characters (ASCII 48 - 57) then the string is checked for **Invalid Non-numeric Character**.
- c. If the TEI is "SER " and the data string is longer than 30 characters, the string is checked for **Serial Number - Too Long**.
- d. If the TEI is "SEQ " and the data string is longer than 30 characters, the string is checked for **Serial Number - Too Long**.
- e. If the TEI is "PNO " (ASCII 50) and the data string is longer than 30 characters, the string is checked fails for **Invalid Long**.
- f. If the TEI is "MFR " or "SP" and the data string is longer than 30 characters, the string is checked for **Invalid Long**.

Page 1

APPENDIX A

A properly constructed UID can be created using many possible combinations of formats and data. The following paragraphs define the permissible combinations that meet the IUID program requirements.

ISO 15434 syntax

The UID must be constructed using ISO 15434 syntax. The first 3 characters of must be "[" - (ASCII character 91), ")" - (ASCII character 41), and ">" - (ASCII character 62) (i.e."[]>"). This combination is the ISO 15434 Start String, a three character string indicating ISO/IEC 15434 compliance.

The data string must end with an EOT (End of Transmission - ASCII character 004). The EOT is a message trailer that identifies the end of the UID within the ISO 15434 data string.

Between the Start String and the EOT the UID must contain at least one record and one data element. A record begins and ends with an RS (Record Separator - ASCII character 30).

Within the record, e.g. between the record separators, there must be a two digit format code (05, 06, or 12) defining the type of data in the record followed by a GS (Group Separator - ASCII character 29) in front of each data element in the record.

FORMAT CODE 05

If the format code for the record is "05" then the remainder of the string will be broken into segments beginning with a Group Separator followed by a 2 or 4 digit Application Identifier. The remainder of the segment will contain the data string.

The following are the acceptable Application Identifiers:

- a. "01" (ASCII 48) + (ASCII 49)

An AI of "01" indicates the remaining characters in that segment are a Global Trade Item Number. The GTIN is defined as a globally unique EAN.UCC System identification

QCTS Tools in Development

Mobile **QCTS**
Data Matrix **Builder**
XML File **Compliance**
IUID Wiki
Registry Item **Update**
Registry Item **Delete**
Data File **Upload**
DoN **Central** IUID Database

Other Issues

- Most legacy systems are **not IUID capable**
- IUID could provide some **immediate benefit** if legacy systems were 2D matrix aware
- Modifying legacy systems is expensive, dangerous and usually **forbidden**
- Fast, cheap, inexpensive **alternative needed**

Alternative Approach

- Non-intrusive Front End (NiFE)
 - Independent software module
 - Sits between legacy system and user
 - Supports 2D data matrix and scanners
 - Translates UI into legacy key data

- Requires **no modification** of Legacy System
 - No software changes
 - No Database changes
 - No Regression testing
 - No Risk

NiFE

- NiFE is a **family of Tools**
 - Each supports different technical challenge areas.
- All systems in a common area **share common NiFE tools**
 - Lower Cost
 - Better Product
 - Faster implementation
