Department of Defense Guide to Uniquely Identifying Items

Assuring Valuation, Accountability and Control of Government Property

Version 2.5
September 15, 2012

Office of the Deputy Under Secretary of Defense
(Acquisition, Technology & Logistics)
INTENDED USER

This guide is intended for use by Department of Defense (DoD) contractors and their suppliers who put unique item identifier (UII) marks on new items during production, as directed in the contract.

This guide is also intended for use by the DoD Components and their agents, who are required to mark UIIs on applicable legacy items in inventory and in operational use.

Within these user communities, the targeted audience is the user of automatic identification technologies, such as bar codes and bar code readers. Data that identifies an item is encoded in a bar code. The bar code is placed on the item. The user retrieves the identification data with a reader and sends it to a data base. The DoD uses the Data Matrix two-dimensional bar code for the UII mark.

SUMMARY OF GUIDE CHANGES

This Version 2.5 of the Department of Defense Guide to Uniquely Identifying Items replaces all previous versions.

Summary of Changes from Version 2.0 (Dated October 7, 2008) to Version 2.5:

a. Content changes were incorporated in the basic document:

   • To add a section to the Preface to define the intended users of the guide.
   • To clarify applicability of the item unique identification (IUID) marking criteria in DoD Instruction 8230.04 to: (a) new acquisition items delivered under contracts, and (b) those legacy items not previously marked, which are currently in inventory or operational use, and are managed under DoD Instruction 5000.64 and/or DoD 4140.1-R.
• To clarify that the IUID marking of mission essential and controlled inventory items below the $5,000 unit acquisition cost threshold is only required based on a case-by-case determination by the requiring activity that life cycle traceability is essential.

• To clarify the criteria for the IUID marking of those legacy secondary items managed under DoD 4140.1-R, which were not previously marked, and are currently in inventory, in use, or undergoing maintenance, repair or overhaul.

• To include a section on IUID of special tooling for major defense acquisition programs when such tooling is to be preserved and stored at the completion of production in accordance with the determinations made under the provisions of Title VIII, Section 815, of P.L. 110-417, the Duncan Hunter National Defense Authorization Act for Fiscal Year 2009.

• To change the word “possession” (this implies ownership) to the word “custody” when referring to Government-furnished property physically located in a contractor’s facility.

• Added the Issuing Agency Code of “RH” for the Health Industry Business Communications Council (HIBCC) to Table 3.

• Clarified Figure 4 to indicate that the unique item identifier (UII) data elements are encoded in a Data Matrix that is placed on the item being uniquely identified.

• Included a provision to relax the minimum Data Matrix ECC 200 symbol module size specified in MIL-STD-130 when severe space limitations exist for high-risk items, such as electronic components susceptible to counterfeiting.

• Included the Mobile Equipment Identifier (MEID), the successor to the Electronic Serial Number (ESN), as a DoD recognized IUID equivalent.

• Requirements were added in Chapter 4 for "Through-Life Traceability of UII Items in the DoD IUID Registry”.

b. Appendix A was updated to add definitions for principal and secondary items.
c. Appendix B references were updated to add P.L. 110-417, the Duncan Hunter National Defense Authorization Act for Fiscal Year 2009, Title VIII, Section 815.

d. Appendix C Business Rule #15 was updated to clarify that if an item traceability number of an single element UII is different from an actual serial number that may already be marked on the item, then the traceability number of the single element UII shall not be separately marked on the item in order to avoid having two different serial numbers physically marked on an item. Furthermore, a traceability number used only to create the UII that is not consistent with the item manufacturer's existing serialization may never be encoded in a data matrix using data qualifiers "SER/SEQ" or "S".

e. Appendix C Business Rule #18 was updated to include the requirement: "In order to provide traceability of the embedded UII to its next higher replaceable assembly level within the end item, the end item shall not be identified as the parent item in instances where a replaceable assembly, intermediate component, or subassembly exists that contains an embedded item UII."

f. Appendix D was revised to incorporate standard commercial practice on the use of GS1 identifiers and clarify the use of a UII data set encoded as a single element in a UII mark.

g. Table 5 in Appendix D was revised to add Data Identifier 49P and Text Element Identifier ECI as additional data elements not used in the UII to designate that an item is subject to export control and/or restrictions as identified in the Wassenaar Arrangement.

h. The use of the words "shall", "must", "should", "can", "may" and "will" were edited to assure their usage accurately reflects policy.

i. Changes for compatibility with the changes reflected above, as well as various format corrections, were made throughout.

Chapter 1
The Environment

THE GOVERNMENT PROPERTY MANAGEMENT CHALLENGE

The Government Accountability Office (GAO) aptly describes the challenge faced by today’s managers of Federal Government property: “GAO and other auditors have repeatedly found that the federal government lacks complete and reliable information for reported inventory and other property and equipment, and cannot determine that all assets are reported, verify the existence of inventory, or substantiate the amount of reported inventory and property. These longstanding problems with visibility and accountability are a major impediment to the federal government achieving the goals of legislation for financial reporting and accountability. Further, the lack of reliable information impairs the government’s ability to (1) know the quantity, location, condition, and value of assets it owns, (2) safeguard its assets from physical deterioration, theft, loss, or mismanagement, (3) prevent unnecessary storage and maintenance costs or purchase of assets already on hand, and (4) determine the full costs of government programs that use these assets. Consequently, the risk is high that the Congress, managers of federal agencies, and other decision makers are not receiving accurate information for making informed decisions about future funding, oversight of federal programs involving inventory, and operational readiness.”

2 Ibid., page 5: The GAO observes that “In the 1990s, the Congress passed the Chief Financial Officers Act of 1990 and subsequent related legislation, the Government Management Reform Act of 1994, the Government Performance and Results Act of 1993, and the Federal Financial Management Improvement Act of 1996. The intent of these acts is to (1) improve financial management, (2) promote accountability and reduce costs, and (3) emphasize results-oriented management. For the government’s major departments and agencies, these laws (1) established chief financial officer positions, (2) required annual audited financial statements, and (3) set expectations for agencies to develop and deploy modern financial management systems, produce sound cost and operating performance information, and design results-oriented reports on the government’s financial position by integrating budget, accounting, and program information. Federal departments and agencies work hard to address the requirements of these laws but are challenged to provide useful, reliable, and timely inventory data, which is still not available for daily management needs.”
THE DEFINITION OF ITEMS

For the purposes of this guide, an item is a single hardware article or a single unit formed by a grouping of subassemblies, components, or constituent parts.3

THE OBJECTIVES

DoD Directive 8320.03, Unique Identification (UID) Standards for a Net-Centric Department of Defense, March 23, 2007, provides for UID data standards development and implementation of the Department’s UID strategy. It establishes policy and prescribes the criteria and responsibilities for creation, maintenance, and dissemination of UID data standards for discrete entities to enable on-demand information in a net-centric environment, which is an essential element in the accountability, control, and management of DoD assets and resources. It also establishes policy and assigns responsibilities for the establishment of the Department’s integrated enterprise-wide UID strategy and for the development, management, and use of unique identifiers and their associated authoritative data sources in a manner that precludes redundancy.4 Item unique identification (IUID) is the fundamental element of the Department’s strategy for the management of its tangible items of personal property. A corresponding DoD Instruction 8320.04, Item Unique Identification (IUID) Standards for Tangible Personal Property, has been issued for policy implementation.

DoD Instruction 5000.64, Defense Property Accountability, requires that accountability records be established for all property (property, plant and equipment) with a unit acquisition cost of $5,000 or more, and items that are sensitive or classified, or items furnished to third parties, regardless of acquisition cost. Property records and/or systems are to provide a complete trail of all transactions, suitable for audit.5

DoD 4140.1-R, DoD Supply Chain Material Management Regulation, requires accountability and inventory control requirements for all secondary items of property and materiel received in the wholesale supply system.

A key component of effective property management is to use sound, modern business practices.

3 DFARS 252.211-7003(a).
4 Redundancy occurs when the same item is assigned multiple UIIs.
5 Property accountability records and systems shall contain the data elements specified in DoD Instruction 5000.64, paragraph 6.6, including part number, cost, national stock number, unique item identifier (UII) or DoD recognized item unique identification (IUID) equivalent, and other data elements listed.
In terms of achieving the desirable end state of integrated management of items, the collective DoD goal shared by all functional processes involved in property management is to uniquely identify items, while relying to the maximum extent possible on international standards and commercial item markings and not imposing unique Government requirements. Unique identification of items will help achieve:

- Integration of item data across the DoD and Federal and industry asset management systems, as envisioned by the DoD Business Enterprise Architecture (BEA)\(^6\), to include improved data quality and global interoperability and rationalization of systems and infrastructure.
- Improved item management and accountability.
- Improved asset visibility and life cycle management.
- Clean audit opinions on item portions\(^7\) of DoD financial statements.

**ITEM MANAGEMENT**

The acquisition, production, maintenance, storage, and distribution of items require complete and accurate asset records to be effective, and to ensure mission readiness. Such records are also necessary for operational efficiency and improved visibility, as well as for sound financial management. Physical controls and accountability over items reduce the risk of (1) undetected theft and loss, (2) unexpected shortages of critical items, and (3) unnecessary purchases of items already on hand.

**THE PLAYERS**

Program managers and item managers lead the coordinated efforts of various stakeholders. The principal functional stakeholders in item management are Engineering Management; Acquisition Management; Property and Equipment Accountability; Logistics Management and Accountability; and Financial Management. Asset visibility is crosscutting to these five functions. Their interests involve the following:

---

\(^6\) On March 12, 2010, the DoD Business Transformation Agency (BTA) released the Business Enterprise Architecture (BEA 7.0), which defines the processes, roles, data structures, information flows, business rules, and standards required to guide improvements in the Core Business Missions (CBMs) of the Department.

\(^7\) These financial statement portions are (1) Property, Plant and Equipment and (2) Operating Materials and Supplies.
Engineering Management
DoD Directive 5000.1, Defense Acquisition System, requires that acquisition programs be managed through the application of a systems engineering approach that optimizes total system performance and minimizes total ownership costs. A modular, open-systems approach is employed, where feasible. For purposes of item management, engineering plays a crucial role in the documentation of technical data that defines items and the configuration management of these items throughout their useful life.

Acquisition Management
The Federal Acquisition Regulation (FAR) Part 45, Government Property, prescribes policies for furnishing Government property to contractors including the use, maintenance, management and reporting of Government-furnished property and contractor-acquired property, and for the return, delivery, or disposal of Government-furnished property and contractor-acquired property.

Property and Equipment Accountability
DoD Instruction 5000.64\(^8\) provides a comprehensive framework for DoD property accountability policies, procedures, and practices; and assists DoD property managers, accounting and financial officers, and other officials in understanding their roles and responsibilities relating to property accountability. It establishes accountability and management policy for tangible DoD-owned equipment and other accountable property; and contains concepts useful for asset management throughout the Department, particularly for property in the possession of individual military units and end-users. It excludes property and materiel for which accountability and inventory control requirements are prescribed in DoD 4140.1-R and DoD 4000.25-2-M\(^9\).

Logistics Management and Accountability
DoD Directive 4140.1, Materiel Management Policy, specifies policies for materiel management. It is the Department’s policy that:

- Materiel management is responsive to customer requirements during peacetime and war.
- Acquisition, transportation, storage, and maintenance costs are considered in materiel management decisions.

---

\(^8\) DoDI 5000.64 integrates the broad requirements of the Federal Property and Administrative Services Act of 1949, as amended (Act of 30 June 1949, 63 Stat. 372), and the Chief Financial Officers (CFO) Act of 1990 into an overarching property accountability policy for property, plant and equipment. This instruction complements the accounting and financial reporting requirements contained in DoD 7000.14-R.

\(^9\) Military Standard Transaction Reporting and Accounting Procedures (MILSTRAP).
- Standard data systems are used to implement materiel management functions.
- The secondary item inventory is sized to minimize the Department's investment while providing the inventory needed to support peacetime and war requirements.
- Materiel control and asset visibility are maintained for the secondary item inventory.

DoD 4000.25-M, Defense Logistics Management System (DLMS) Manual, prescribes logistics management policy, responsibilities, procedures, rules, and electronic data communications standards for the conduct of logistics operations in the functional areas of supply, transportation, acquisition (contract administration), maintenance, and finance\textsuperscript{10}.

Financial Management

DoD Instruction 7000.14, Department of Defense Financial Management Policy and Procedures, specifies that all DoD Components shall use a single DoD-wide financial management regulation for accounting, budgeting, finance, and financial management education and training. That regulation is DoD 7000.14-R, Department of Defense Financial Management Regulations. It establishes financial management requirements, systems, and functions for all appropriated, non-appropriated, working capital, revolving, and trust fund activities. In addition, it directs statutory and regulatory financial reporting requirements.

Joint Total Asset Visibility

Joint total asset visibility is the cross-cutting capability that provides Combatant Commanders, the Military Services, and the Defense Agencies with timely and accurate information on the location; movement; status; and identity of units, personnel, equipment, and supplies\textsuperscript{11}.

\textsuperscript{10}The DLMS is a system governing logistics functional business management standards and practices rather than an automated information system.

\textsuperscript{11}“In every troop deployment this century, DoD has been plagued by a major difficulty—the inability to see assets as they flow into a theater and are in storage. This situation has led to direct and significant degradation in operational readiness. When assets in the pipeline are not visible, they are difficult to manage. Property is lost, customers submit duplicate requisitions, superfluous materiel chokes the transportation system, and the cycle continues. Assets at the retail level that are not visible and, therefore, not available for redistribution, further compound the degradation of operational readiness.” Joint Total Asset Visibility Strategic Plan, January 1999, Joint Total Asset Visibility Office, DoD.
PROCESSES, ACTIVITIES AND ACTIONS

Item management involves many functional processes, activities and actions. These elements are integrated and flow smoothly so that the needs of warfighters for items are satisfied when and where they occur. The functional processes, activities, and actions impacting item management are arrayed in Table 1 in summary format to show how they are related and interdependent.

Table 1. Functional Processes Impacting Item Management
DIFFERENTIATING ITEMS THROUGHOUT THE SUPPLY CHAIN

The Department uniquely identifies the items to which it takes title to provide sufficient asset accountability, valuation and life cycle management. Unique identification provides the Department the opportunity to differentiate an individual item from all others. Unique identification of items provides the Department with the information architecture to facilitate accomplishment of the following:

- Improve the acquisition of equipment and performance based logistics services for the warfighter,
- Capture timely, accurate and reliable data on items (i.e., equipment, reparables, materials, and consumables),
- Improve life-cycle asset management, and
- Track items in the Department and industry systems for operational, logistic\textsuperscript{12}, and financial accountability purposes.

ACCOUNTING FOR ACQUIRED ITEMS

Accountability of items begins when hardware (equipment and reparables) and supplies (materials and consumables) are acquired through purchase, lease, or other means, including transfer or fabrication, whether the hardware and supplies are already in existence or yet to be created, developed, demonstrated, and evaluated\textsuperscript{13}. DoD Instruction 5000.64 requires that accountability records be established for all property (i.e., property and equipment) purchased, or otherwise obtained, having a unit acquisition cost of $5,000 or more, for leased assets of any value, for items that are classified or sensitive, for items furnished to or in the possession of third parties, and other property when otherwise required by law, policy, regulation, or Agency direction\textsuperscript{14}. Property accountability records and systems shall contain the data elements specified in DoD Instruction

\textsuperscript{12} DoD 4140.1-R, May 2003, chapter 5, section C5.7.3, addresses Unique Item Tracking (UIT) policy for logistics.

\textsuperscript{13} See American Society for Testing and Materials Standard E-2135-02, Standard Terminology for Property and Asset Management.

\textsuperscript{14} DoDI 5000.64, May 19, 2011, op. cit., paragraphs 6.2 through 6.5.
The Need to Uniquely Identify Items

5000.64, paragraph 6.6, including part number, cost, national stock number, unique item identifier (UII) or DoD recognized item unique identification (IUID) equivalent, and other data elements listed\(^\text{15}\).

For materiel covered under DoD 4140.1-R, accountability records are established for all materiel received, regardless of cost\(^\text{16}\).

**Contractor-Acquired Property on Cost-Reimbursement Type Contracts**

Title to property whose cost is reimbursable to the contractor passes to and vests in the Government upon: (1) delivery to the contractor of an item purchased by the contractor and reimbursed as a direct cost under the contract, (2) issuance of the property for use in contract performance; (3) commencement of processing of the property or use in contract performance; or (4) reimbursement of the cost of the property by the Government, whichever occurs first. The Government acquires title to all property purchased or fabricated by the contractor in support of contract performance and may take title to Production Special Tooling in accordance with the contract clauses. However, if such items are to be delivered to the Government, they shall be delivered under a contract line item or subline item\(^\text{17}\). Unless required otherwise in the contract, such property shall be marked with a UII only upon its delivery to the Government, provided that it meets the UII marking criteria.

**Establishing Item Acquisition Cost**

It is essential that contracts contain specific arrangements to capture the acquisition cost of all delivered items because the acquisition cost shall form the basis for the entries made in the Department’s financial statements and shall determine the degree to which those statements comply with the requirements of the Federal Accounting Standards Advisory Board (FASAB). Ideally, acquisition cost for items would be recorded at the time these items are delivered to and accepted by the Government.

**Using Contract Line Items**

All property delivered to the Government shall be delivered on a contract line item (CLIN) or subline item (SLIN). The acquisition cost of each item

\(^{15}\) Ibid., paragraph 6.6 specifies the minimum data elements required.

\(^{16}\) See Section C5.3, Item Accountability, Control and Stewardship, DoD 4140.1-R.

\(^{17}\) For additional information, see DFARS Procedures, Guidance and Instructions (PGI) 245.401-70 Contractor-acquired property.
The Need to Uniquely Identify Items

entering the Government property inventory is captured on the contract line item or subline item.

CLINs and SLINs are established when the contract is structured prior to award and shall be included for all items for which the Government shall take delivery, either during the performance or at the completion of the contract. The estimated acquisition cost of property shall be identified upon delivery.

Table 2 shows that the acquisition cost of items delivered under a contract that are separately priced under CLINs or SLINs. Informational subline items are used to capture the acquisition cost for items to be delivered when separately priced CLINs or SLINs are not practicable. Informational SLINs used only for identification of acquisition cost have to be clearly marked as such so they are not confused with delivery, acceptance, and payment requirements of the contract. When the acquisition costs for like items differ, separate informational SLINs are used to identify the acquisition cost for each of the items with a different acquisition cost.

<table>
<thead>
<tr>
<th>Deliverable</th>

<td>Fixed Price- use CLIN/SLIN values Cost Type-use contractor estimated costs. DoD shall address delta $ from final total price.</td>
</tr>
</tbody>
</table>

Table 2. Contract Requirements – Identifying Unit Acquisition Cost

\(^{18}\)DFARS 252.211–7003 requires a contract attachment to list embedded DoD serially managed subassemblies, components, and parts that are to be uniquely identified. The IUID data are reported at the time of delivery, either as part of, or associated with the Material Inspection and Receiving Report.
To comply with the IUID policy that UIIs be delivered on a CLIN/SLIN, the Contracting Officer shall modify a contract to establish separate CLINs/SLINs prior to delivery of items that were not identified as contract deliverables at the time of contract award.

Valuation of Items for the IUID Registry

Both the unique identification and the value of items that shall be delivered under the contract need to be reflected in the Department’s property accountability and management information systems. According to DoD Instruction 5000.64, acquisition cost shall be the basis for valuation of property.

For fixed price contracts, the acquisition cost for items to be delivered is the fixed price paid by the Government.

For cost type contracts, the acquisition cost for items to be delivered is the Contractor’s estimated cost at the time the item is delivered.

The acquisition cost of components within delivered items need not be identified.

A delivered item may be composed of embedded items, such as subassemblies, components and parts. The prime contractor shall pass down appropriate specifications and contract requirements, including the IUID marking requirements where applicable, to the tiered vendors for subcontracted subassemblies, components, and parts.

Spares may be purchased directly from the vendor(s) or through the prime. IUID-qualifying spare items (subassemblies, components, and parts) have to be marked appropriately with the UII data elements.

So, when the prime delivers the complete item that is one UII. The spares are delivered with their own UIIs. The prime is responsible to ensure the marking and registering of UII data elements for those DoD serially managed embedded items and their parent items in the delivered complete item.
Chapter 3
Requirements for Item Unique Identification

WHAT IS AN ITEM?

As stated earlier in this guide, an item is a single hardware article or a unit formed by a grouping of subassemblies, components, or constituent parts\(^{19}\). In this definition, hardware is a generic term dealing with physical items (as distinguished from a capability or function) such as equipment, tools, implements, instruments, devices, sets, kits, outfits, fittings, trimmings, assemblies, subassemblies, components, and parts\(^{20}\).

DECIDING WHAT ITEMS ARE TO BE IDENTIFIED AS UNIQUE

Items Delivered Under Contracts and Legacy Items in Inventory and Operational Use

Item unique identification is driven by an integrated set of logistics, acquisition, and financial requirements to identify and track item information. For DoD IUID purposes, Figures 1 and 2 contain decision trees for deciding what items shall be uniquely identified.

The criteria in Figure 1 apply when the items are delivered under contract or they are existing legacy principal items\(^{21}\) in inventory, in use, or undergoing maintenance, repair, or overhaul. Items being delivered under contract, including new equipment, major modifications, reprocurements of equipment and spares, shall include the contract clause Defense Federal Acquisition Regulation Supplement (DFARS) 252.211-7003 to invoke the IUID requirement\(^{22}\).

\(^{19}\) DFARS 252.211-7003(a).
\(^{20}\) Joint Publication 1-02, DoD Dictionary.
\(^{21}\) Principal items are end items and replacement assemblies of such importance that management techniques require centralized individual item management throughout the supply system, to include depot level, base level, and items in the hands of using units. These specifically include the items where, in the judgment of the Services, there is a need for central inventory control, including centralized computation of requirements, central procurement, central direction of distribution, and central knowledge and control of all assets owned by the Services. (Joint Publication 1-02)
\(^{22}\) DoDI 8320.04, paragraph 5.4.1, permits alternative implementation provided that the acquired items are marked and registered no later than 30 days after receipt.
All items delivered to the Government under contract and legacy principal items in inventory or use require item unique identification, or a DoD recognized unique identification equivalent, if one or more of the following criteria apply (each discussed separately):

1. All items for which the Government’s unit acquisition cost is $5,000 or more;

2. Items for which the Government’s unit acquisition cost is less than $5,000, when identified by the requiring activity\(^{23}\) as DoD serially managed;

3. Mission essential, controlled inventory, or any other items for which the Government’s unit acquisition cost is less than $5,000, when the requiring activity determines that permanent identification is required;

4. Regardless of value, (a) any DoD serially managed subassembly, component, or part embedded within an item and, (b) the parent item (as defined in DFARS 252.211-7003(a)) that contains the embedded subassembly, component or part;

5. Regardless of value, any item of contractor-acquired or Government-furnished special tooling as defined by Federal Acquisition Regulation 2.101(b) for a major defense acquisition

---

\(^{23}\) The requiring activity will make this determination and list the items in the DFARS 252.211-7003 contract clause. For legacy items, the requiring activity will make this determination in order to identify principal items in inventory or use for item unique identification.
program that is designated for preservation and storage in accordance with the requirements of section 815 of the Duncan Hunter National Defense Authorization Act for Fiscal Year 2009 (Pub. L. 110-417).

Legacy Secondary Items

The criteria in Figure 2 apply to legacy secondary items\textsuperscript{24} in inventory, in use, or undergoing maintenance, repair, or overhaul. IUID marking for these legacy secondary items, which are subject to the materiel management policies of DoD 4140.1-R, only apply when such items are:

(a) DoD serially managed items that are also – at the same time – categorized as sensitive, critical safety, or pilferable items;

(b) Reparable items;

(c) Non-reparable items that the requiring activity decides require item level traceability at any point in their life cycle.

Figure 2. Uniquely Identifying Items Legacy Secondary Items in Inventory or Use

\textsuperscript{24} Secondary items are items that are not defined as principal items and include reparable components, subsystems, and assemblies, consumable repair parts, bulk items and material, subsistence, and expendable end items, including clothing and other personal gear. (DoD 4140.1-R)
UNIT ACQUISITION COST THRESHOLD

The first IUID criterion establishes the $5,000 value as the unit acquisition cost threshold for item unique identification. All items at this threshold or above are required to have item unique identification in accordance with the threshold requirement for establishing property records. Although DoDI 5000.64 does not require items under $5,000 to have property records unless they are leased assets of any value, items that are classified or sensitive, items furnished to or in the possession of third parties, or otherwise required by law, policy, regulation, or Agency direction, a program manager shall examine the other IUID criteria to determine if items below the $5,000 threshold require item unique identification.

IUID OF ITEMS BELOW THE $5,000 THRESHOLD

There are two fundamental characteristics listed in the second IUID criterion to be considered in determining item unique identification requirements for items whose unit acquisition cost is less than $5,000. These characteristics are the requiring activity determination for: (a) DoD serially managed items, and (b) unique identification of mission essential and controlled inventory items.

Requiring Activity Determination

DoD Serially Managed

A distinction is made between “serialized items” and “DoD serially managed” items when uniquely identifying items less than $5,000. While DoD may use an item that has been serialized by the manufacturer, DoD may not manage the item by means of its serial number. When DoD elects to manage an item by its serial number it becomes "DoD serially managed". This means it is a tangible item used by DoD, which is designated by a DoD or Service Item Manager to be uniquely tracked, controlled or managed in maintenance, repair and/or supply by means of its serial number.\footnote{A serial number is an assigned combination of numbers and/or letters to an item instance that separately identifies that item instance from all others within a product or organization.}

DoD serially managed items require UIIs. Serial numbers may be unique within a product or organization, but UIIs are globally unique. This permits an item to be uniquely distinguishable in different databases.
A broad variety of items fall into the DoD serially managed category through programs for serial number tracking, serialized item management, and unique item tracking. Examples of DoD serially managed items may include reparable items down to and including sub-component reparable unit level; life-limited, time-controlled, or items requiring records (e.g., logbooks, aeronautical equipment service records); and items that require technical directive tracking at the part level26.

**Traceability for Mission Essential Items**

Item essentiality is a measure of an item's military worth in terms of how its failure would affect the ability of a weapon system, end item, or organization to perform its intended functions. Military mission essentiality is the composite effect of an item on the overall military mission based on the most critical significant application of the item27. The primary use of military mission essentiality is in supply chain management for determining resource allocations, determining degree of management intensity, and communicating essentiality among the DoD Components. An assessment of mission essentiality shall include item essentiality and the degree to which it impacts on the overall military mission. The requiring activity shall determine on a case-by-case basis that IUID is required for the traceability of mission critical items.

**Traceability for Controlled Inventory Items**

The DoD employs item accountability, control, and stewardship procedures to ensure that assets are protected against waste, loss, negligence, unauthorized use, misappropriation, and compromise28. Controlled inventory items are those items designated as having characteristics that require they be identified, accounted for, segregated, or handled in a special manner to ensure their safeguard and integrity. They include classified items (require protection in the interest of national security); sensitive items (require a high degree of protection and control due to statutory requirements or regulations, such as precious metals; items of high value, highly technical, or hazardous nature; and small arms); pilferable items (items having a ready resale value or application to personal possession, which are especially subject to theft)29; and safety controlled items. The requiring activity shall determine on a case-by-case basis that IUID is required for the traceability of controlled inventory items.

---

26 DUSD(Logistics & Material Readiness) Memorandum, September 4, 2002, Serialized Item Management
27 DoD 4140.1-R
28 DoD 4140.1-R
29 DoD 4100.39-M, Volume 10, Table 61
Other Compelling Reasons for Items Below the $5,000 Threshold

This criterion provides the authority for the requiring activity to specify items for item unique identification based on any other rationale not previously listed above. Some items that are under the $5,000 threshold and do not qualify for IUID under the stated criteria may benefit from permanent unique identification. The requiring activity that deems it appropriate to provide permanent unique identification for items shall require IUID. Government property that is placed in service in the custody of contractors is an example of items that shall be marked with UIIs at the time of acquisition or transfer to the custody of the contractor.

**IUID of Embedded Items Regardless of Value**

Embedded items include subassemblies, components, or parts that are integral to the item being delivered. The embedded items that are serially managed by DoD require IUID. These items shall be listed in the contract in order to clearly indicate which items are to be marked. This criterion is applied without regard to the value of the embedded item.

Each uniquely identified embedded item is contained within a higher assembly known as its parent item. The parent item shall be chosen at any appropriate level of configuration above the level of the embedded item provided that the parent item is a higher assembly, intermediate component, or subassembly that is itself DoD serially managed. The parent item of a DoD serially managed embedded item is also required to have a UII. This criterion is applied without regard to the value of the parent item.

The supply management and repair concepts for embedded items and parent items may dictate that multiple tiers of embedded items and parent items are needed for complex systems.

---

Parent item means the item assembly, intermediate component, or subassembly that has an embedded item with a unique item identifier or DoD recognized IUID equivalent.
IUID OF SPECIAL TOOLING FOR MAJOR DEFENSE ACQUISITION PROGRAMS

Section 815 of the Duncan Hunter National Defense Authorization Act for Fiscal Year 2009 (Pub. L. 110-417) requires the Department to plan for the preservation and storage of unique tooling associated with the production of hardware for major defense acquisition programs through the end of the service life of the related weapons system. Unique tooling is one-of-a-kind tooling without which the item could not be produced. For DoD purposes, the term “unique tooling” is appropriately defined by the well-known term “special tooling”, as defined in FAR 2.101(b).

The USD(AT&L) policy memorandum, dated August 3, 200931, provided guidance for the implementation of the statute. The provisions in this memorandum are: (a) special tooling retention shall continue to be reviewed during the life of the program, (b) special tooling designated for preservation and storage shall be serially managed and uniquely identified as directed in DoDI 8320.04 “Item Unique Identification (IUID) Standards for Tangible Personal Property”, and (c) special tooling shall be refurbished if it has reached the end of its service life prior to its preservation and storage, as required.

IUID OF SETS, KITS, AND OUTFITS

Sets, kits, and outfits (SKO) are assemblages of components, support items, or mission specific and common tools in a container (for example, a bag, pouch, box, chest, van, trailer, or shelter) that are used in association. SKOs are primarily designed to accomplish a specific mission or maintenance function. They are identified, cataloged, authorized, and issued as a single unit. They may be made up of components, support items, and tools included in more than one class of supply; may include end items; may include components, support items, and tools for which logistic responsibilities are assigned to more than one agency; and may include nonexpendable, durable, and expendable components, support items, and tools. The SKO is an item of supply, configuration controlled by a part number or line identification number.

For purposes of both property accountability and materiel management of secondary items, a SKO shall have a UII if it meets the qualifying criteria for tracking and valuation purposes as long as it resides in the inventory. If any of the components of the SKO are DoD serially managed items, they would be uniquely identified separately as embedded items in the parent item. In this case the parent item is the SKO of which the DoD serially managed components are a part. The embedded item would not be separately valued, since the value of the embedded item is capitalized in the value of the SKO.

An SKO could be a set of components for a single assembly part, packaged together as a single part number, for inclusion into one assembly during a maintenance function or configuration change. This type of SKO is most often referred to as a kit. Once the kit is applied to an assembly, the kit is “consumed” and capitalized as part of the value of the assembly in which it is installed; and the UII for the kit would be retired. The assembly in which the kit is installed would become the new parent item for any embedded items from the kit.

LEGACY ITEMS IN OPERATIONAL USE AND INVENTORY

Program and item managers shall prepare implementation plans for implementation of IUID on legacy items in operational use, including items undergoing maintenance, repair or overhaul, and in inventory. Only those legacy items determined in these implementation plans to meet the IUID criteria specified in Figures 1 and 2 above shall require UII marking. For legacy items, the $5,000 acquisition criteria applies to the actual acquisition cost, if known; as opposed to the replacement cost or depreciated value. All Government property in the contractor's custody shall require assignment and registration of a UII, in accordance with the government property accounting rules.

When applying item unique identification to legacy items already in inventory or operational use\(^{32}\), all items that meet the IUID criteria shall be assigned a UII and marked. If serialized items can be uniquely identified by their existing serial numbers and markings, virtual unique item identifiers (UIIs) can be assigned\(^{33}\).

---

\(^{32}\) This is required by USD(AT&L) Memorandum, dated December 23, 2004, Subject: Policy for Unique Identification (UID) of Tangible Personal Property Legacy Items in Inventory and Operational Use, Including Government Furnished Property (GFP), available for download at [http://www.acq.osd.mil/dpap/pdi/uid/policy_and_regulations.html](http://www.acq.osd.mil/dpap/pdi/uid/policy_and_regulations.html).

\(^{33}\) The enterprise identifier used in marking a legacy item shall be the enterprise identifier of the entity assigning and registering the UII. Use of the existing part number and/or existing serial number or re-
A virtual UII enables the database entry of a UII and its associated data, while postponing the physical marking of the legacy item with a two-dimensional Data Matrix symbol to the next opportunity to mark based on logistic and economic considerations. In addition to legacy items already in the inventory or operational use, DoD resident equipment and spares in the custody of contractors may also be assigned virtual UIIs until an item is subject to transfer at which time the physical marking of the item shall be accomplished. The use of virtual UIIs is described in the latest version of the Guidelines for the Virtual Unique Item Identifier (UII).
Chapter 4
Determining Uniqueness of Items

DEFINING THE DATA ELEMENTS FOR THE UNIQUE ITEM IDENTIFIER

What is the Unique Item Identifier (UII)?
The unique item identifier (UII) is a globally unique and unambiguous identifier that distinguishes an item from all other like and unlike items.

The UII is a value that is derived from a UII data set of one or more data elements plus a prefix consisting of the Issuing Agency Code (IAC) for the enterprise identifier (see Table 3). The UII data set is marked on items in a Data Matrix ECC 200 symbol. In applying the IUID rules and requirements, care shall be given to the distinction among the UII, the UII data set, and the mark or item data encoded string (IDES) containing the UII data set.

For items that are serialized within the enterprise identifier, the UII data set includes the data elements of enterprise identifier and a unique serial number (Construct #1). For items that are serialized within the part, lot, or batch number within the enterprise identifier, the UII data set includes the data elements of enterprise identifier, the original part number or lot or batch number, and the serial number (Construct #2). In addition to the two constructs composed of multiple data elements, the UII data set may be represented by a UII data set encoded as a single element from which the UII shall be derived. The DoD recognized IUID equivalents of Global Individual Asset Identifier (GIAI), Global Returnable Asset Identifier (GRAI) when assets are serialized\(^{37}\), Vehicle Identification Number (VIN), or Electronic Serial Number (ESN)/Mobile Equipment Identifier (MEID) (for cell phones only), each consisting of a single data element, are discussed later.

The data to derive the UII is marked on items encoded within an ECC200 Data Matrix symbol along with additional data to comply with international standards\(^{38}\). An important distinction is the relationship between the UII and the IDES. The UII is a string of capital letters and numbers and perhaps a dash and/or forward slash. The IDES, however, is

---

\(^{37}\) The Global Returnable Asset Identifier (GRAI) shall contain a unique serial number for DoD recognized IUID equivalent application. Other variations of the GRAI are unacceptable for IUID.

\(^{38}\) ISO/IEC 15434 syntax is required for all Data Matrix marks. ISO/IEC 16022 shall also apply.
everything encoded into the Data Matrix symbol. The IDES may include UII data as well as additional data, not found in the UII. It is also the case that the UII may include data not found in the IDES. Even so, the UII can always be derived from the IDES in accordance with the rules found in Tables 6, 7 and 8 in appendix D of this Guide.

The Notion of an Enterprise

The first requirement is enterprise identification. An enterprise, in the context of UID, is the entity responsible for assigning a UII to an item. This responsibility commits the entity to ensuring the uniqueness of the UII at the time of its assignment and continued uniqueness among future UIIs. For purposes of item unique identification, an enterprise identifier shall define each entity location that has its own unique, separate, and distinct operation. An enterprise may be an entity such as a manufacturer, supplier, depot, program management office, or a third party. An enterprise identifier is a code uniquely assigned to an enterprise by a registered issuing agency. An issuing agency is an organization responsible for assigning a non-repeatable identifier to an enterprise [e.g., Dun & Bradstreet’s Data Universal Numbering System (DUNS) Number, GS1 Company Prefix (formerly Uniform Code Council (UCC)/European Article Numbering (EAN) International Company Prefix), Allied Committee 135 NATO Commercial and Government Entity (NCAGE)/Commercial and Government Entity (CAGE) Code, Department of Defense Activity Address Code (DODAAC), or the Coded Representation of the North American Telecommunications Industry Manufacturers, Suppliers, and Related Service Companies (ATIS-0322000) Manufacturer's Identification Code (MIC)].

Unique Identification of Items

The other key aspect of constructing a UII is the unique identification of each item that the enterprise is identifying. There are two acceptable constructs discussed here which are determined by how the enterprise serializes items. Later in this chapter specific commercially-used unique identifiers—DoD recognized IUID equivalents—are discussed for alternative use.

---

39 The enterprise identifier (EID) in the UII is the entity that is responsible for compliance with the UII rules. An entity cannot commit another entity to that responsibility without authority. The fundamental principle is: Never use another entity’s enterprise identifier in the UII without permission or direction from the competent authority for that enterprise identifier.
Serialization Within the Enterprise Identifier (Construct #1)

For items that are serialized within the enterprise identifier, the UII is a combination of the issuing agency code\(^{40}\), enterprise identifier, and the serial number, which shall be unique within the enterprise identifier. The unique serial number within the enterprise identifier is a combination of numbers or letters assigned by the enterprise (e.g., a manufacturer, depot, or vendor) to an item that provides for the differentiation of that item from any other like or unlike item and is never used again within the enterprise identifier. The data elements of enterprise identifier and unique serial number within the enterprise identifier provide the permanent identification for the life cycle of the item\(^ {41}\).

Serialization Within the Part, Lot, or Batch Number (Construct #2)

For items that are serialized within the part, lot, or batch number, the UII is a combination of the issuing agency code, the enterprise identifier, the original part number or the lot or batch number, and the serial number. The original part number is a combination of numbers, letters, and, in some cases, special characters, assigned by the enterprise (e.g., a manufacturer, vendor, or any party that guarantees the integrity of the part number) at asset creation to a class of items with the same form, fit, function, and interface. Lot or batch number means an identifying number assigned by the enterprise to a designated group of items, usually referred to as either a lot or a batch, all of which were manufactured under the same controlled conditions of production. The serial number within the part, lot or batch number is a combination of numbers and letters assigned by the enterprise (e.g., a manufacturer, vendor, or any party that guarantees the uniqueness of the serialization) to an item that provides for the differentiation of that item from any other like item. The data elements of enterprise identifier, original part number or lot or batch number, and

---

\(^{40}\) The issuing agency code, or IAC, is that assigned by the Registration Authority for ISO/IEC 15459-2, Registration Procedures. The current Registration Authority of ISO/IEC 15459-2 is NEN–Nederlands Normalisatie-instituut. The IAC represents the agency that issued the enterprise identifier. The IAC shall be derived from the data qualifier for the enterprise identifier and is not marked separately on the item. The IAC for the GS1 Company Prefix need not be derived because it is contained in each GS1 Company Prefix. The IAC for the data qualifiers 3V, 18V, 25S, EUC, and UID need not be derived because it is contained in each data element. The IAC shall not be repeated when forming the UII.

\(^{41}\) The UII’s component data elements are separately encoded within the Data Matrix symbol—enterprise identifier and serial number. The IAC is contained within the format of specific component data elements or, for some data qualifiers, only one IAC is applicable for the data qualifier. Reader devices are programmed to use the embedded IAC, or to deduce the IAC from the data qualifier, but the IAC is not encoded as a separate data element in the Data Matrix symbol. When a UII is encoded in a single data element, such as 25S or UID, the concatenation of the IAC, enterprise identifier, and unique serial number is accomplished prior to encoding.
serial number within the original part number or lot or batch number provide the permanent identification for the life cycle of the item\(^{42}\).

**Issuing Agency Codes for Use in Item Unique Identification**

Table 3 contains a list of issuing agency codes (IACs). At the current time, IACs exist for the six most commonly used enterprise identifiers. These IACs are “0 through 9” for the GS1 Company Prefixes assigned by GS1\(^{43}\), “LB” for the ATIS-0322000\(^{44}\) Manufacturer Identification Code (MIC), “UN” for the DUNS assigned by Dun & Bradstreet, “D” for the NCAGE/CAGE assigned by Allied Committee 135, “LH” for the Labeler Identification Code (LIC) assigned by the European Health Industry Business Communications Council, "RH" for the LIC and Health Industry Number (HIN) assigned by the Health Industry Business Communications Council, and “LD” for the Department of Defense Activity Address Code (DODAAC).

\(^{46}\) The first number in a GS1 Company Prefix indicates the issuing agency code.

\(^{47}\) Revision of ANSI T1.220-2000.
Determining Uniqueness of Items

### Including Unique Item Identifier (UII) Data Elements on an Item

**Derivation of the UII**

The UII for an item shall be derived from the data elements included on the item by using a business rule (See Appendix C). The automatic identification technology (AIT) device\(^\text{48}\) machine-reads the data elements on the item and can output the UII. Therefore, it is not necessary to include the UII on the item as a separate data element. It is only required that the data elements required to derive the UII (enterprise identifier, serial number and, for Construct #2 additionally, original part number or lot or batch number) be included on each item\(^\text{49}\). The UII component data elements, at a minimum, shall be contained in a Data Matrix ECC 200 symbol encoded in the syntax of ISO/IEC 15434 and using the semantics of ISO/IEC 15418\(^\text{50}\) or Air Transport Association (ATA) Common Support Data Dictionary (CSDD). Data may also be contained in human-readable information and/or other AIT media (e.g., contact memory.

\(^{48}\) AIT devices include readers, scanners, interrogators, and hybrid devices which may incorporate more than one automatic data capture technology. AIT devices with imaging capability are required to decode Data Matrix ECC 200 symbols.

\(^{49}\) Specific data qualifiers are permitted for UIIs in a single data element. See Appendix D, Table 5.

\(^{50}\) See Appendix D, The Mechanics of Item Unique Identification, for a detailed explanation of encoding the Data Matrix. The full titles of the standards are: ISO/IEC International Standard 15434, Information Technology–Automatic identification and data capture techniques–Syntax for high capacity ADC media and ISO/IEC International Standard 15418, Information technology–Automatic identification and data capture techniques–GS1 Application Identifiers and ASC MH10 Data Identifiers and maintenance (Note that ISO/IEC 15418 refers the user to ANS MH10.8.2 for technical content.).
Determining Uniqueness of Items

buttons, linear bar codes, radio frequency identification) in addition to the Data Matrix ECC 200 symbol. Table 4 shows how the UII is constructed from the data elements placed on the item and the associated business rule. When deriving the UII, the data qualifiers are omitted from the UII.

<table>
<thead>
<tr>
<th>Based on current Enterprise configurations</th>
<th>UII Construct #1</th>
<th>UII Construct #2</th>
</tr>
</thead>
<tbody>
<tr>
<td>The UII is formed by the data elements IN ORDER:</td>
<td>If items are serialized within the Enterprise</td>
<td>If items are serialized within Part, Lot or Batch Number</td>
</tr>
<tr>
<td></td>
<td><strong>Issuing Agency Code</strong> <em>Enterprise ID</em>* Serial Number</td>
<td><strong>Issuing Agency Code</strong> <em>Enterprise ID</em>* Original Part # Serial Number</td>
</tr>
</tbody>
</table>

*The Issuing Agency Code (IAC) represents the registration authority that issued the enterprise identifier (e.g., Dun and Bradstreet, GS1). The IAC can be derived from the data qualifier for the enterprise identifier and is not separately marked on the item. The IAC for the GS1 Company Prefix need not be derived because it is contained in each GS1 Company Prefix. The IAC for the data qualifiers 3V, 18V, 25S, EUC and UID need not be derived because it is contained in each data element. The IAC should not be repeated when forming the UII.

Table 4. Unique Item Identifier (UII) Construct Business Rules

Thus, there are two constructs for determining the UII for an item, depending upon whether the enterprise serializes items within the enterprise identifier or within the original part number or lot or batch number. Although not used to determine the UII, other data elements, such as the current part number, may also be placed on the item. It may be beneficial for an enterprise to select one of the two constructs for exclusive use, rather than attempting to use both constructs within the same enterprise identifier.

UII Derivation Process

Figure 3 depicts how the UII for an item is derived and the business rule for generating the UII from the data elements placed on the item. The AIT reader device shall machine-read the data elements and output the UII for onward transmission to the appropriate automated information system (AIS). The decisions of which construct to use (see Table 4) to uniquely identify items, and use of the data qualifiers and associated business rules, are made by the enterprise assigning serialization to the item and guaranteeing its uniqueness.

---

51 The identification of the agency issuing the enterprise identifier, or the issuing agency code (IAC), is derived by the AIT device from the data qualifier for the enterprise identifier. The IAC is not placed on the item. The IAC for the GS1 Company Prefix need not be derived because it is contained as the first number in each GS1 Company Prefix. The IAC for the data qualifiers 3V, 18V, 25S, EUC and UID need not be derived because it is contained in each data element. The IAC shall not be repeated when forming the UII.
Deciding Where to Place Data Elements for Item Unique Identification on Items

The UII data elements (enterprise identifier, serial number and, for Construct #2 only, original part number or lot or batch number) shall be placed on qualifying items in accordance with the standard practice of MIL-STD-130, Identification Marking of U.S. Military Property, which states a preference for all marking to be machine-readable information using Data Matrix ECC 200 symbols. Commercial-off-the-shelf items that qualify for IUID marking, which are incorporated into end items, shall be marked so that a UII can be derived.

Marking Items with Severe Space Limitations

For severe space limitations beyond those that can be accommodated through the minimum Data Matrix ECC 200 symbol module size (see paragraph 5.1.2.e, MIL-STD-130) for any item deemed to be at risk (e.g. electronic components susceptible to counterfeiting), the IUID compliant data matrix dimension requirements shall be relaxed to allow smaller compliant symbols with a minimum module size of 0.001 inches to be direct part marked on those components. This relaxation of the minimum module size is necessary to allow forensic analysis and confirmation of authenticity of these components, particularly at the component or subcomponent level. The resulting smaller Data Matrix ECC 200 symbol shall not be used by the standard DoD automatic identification and data
Determining Uniqueness of Items

capture infrastructure nor used in standard business processes. Specialized imaging equipment may be required for reading these smaller symbols.

**DOD RECOGNIZED IUID EQUIVALENTS**

Generally, a commercial identifier is considered for inclusion into the list of officially recognized DoD recognized IUID equivalents if it meets these criteria: (1) Shall contain an enterprise identifier; (2) Shall uniquely identify an individual item within an enterprise identifier, product, or part, lot or batch number; and (3) Shall have an existing Data Identifier (DI) or Application Identifier (AI) listed in ANS MH10.8.2, Data Identifier and Application Identifier Standard. In addition, the item marks shall comply with Business Rule #14 for Data Matrix ECC 200 symbol marking and Business Rule #17 which requires that DoD recognized IUID equivalents comply with the IUID minimum data carrier requirements.

The DoD recognizes four commercial unique identifiers as item unique identification equivalents. They are:

1. Global Individual Asset Identifier (GIAI) for serially-managed assets.
2. Global Returnable Asset Identifier (GRAI) for returnable assets which shall contain a unique serial number for DoD IUID equivalent application. Other variations of the GRAI are unacceptable.
3. ISO Vehicle Identification Number (VIN) for vehicles.
4. Electronic Serial Number (ESN)/Mobile Equipment Identifier (MEID) (for cellular telephones only).

**COMPLIANT UNIQUE ITEM IDENTIFIER**

For DoD purposes, a compliant UII is either a Construct #1, Construct #2, Global Individual Asset Identifier (GIAI), Global Returnable Asset Identifier (GRAI), Vehicle Identification Number (VIN), or Electronic Serial Number (ESN)/Mobile Equipment Identifier (MEID) (for cell phones only), whose data element(s) are encoded in a Data Matrix ECC 200 symbol using the ISO/IEC 15434 syntax with ISO/IEC 15418 or ATA CSDD semantics. Construct #1 and Construct #2 may be represented in a UII data set encoded as single element, which is composed of the

---

52 DoD recognized IUID equivalents (or IUID equivalents) are subject to DoD approval.
53 The ESN is being superseded by the Mobile Equipment Identifier (MEID). The MEID universe consists of approximately 16 million blocks of 16 million numbers, compared to the ESN universe of 256 blocks of 16 million numbers. See Telecommunications Industry Association (TIA) White Paper on the Exhaust of Electronic Serial Numbers (ESNs) and Migration to Mobile Equipment Identifiers (MEIDs), November 2007
54 The Global Returnable Asset Identifier (GRAI) shall contain a unique serial number for DoD recognized IUID equivalent application. Other variations of the GRAI are unacceptable for IUID.
necessary data components, with an appropriate item unique identification data qualifier (i.e., 18S, 25S, USN, UST, or UID).

CONSIDERATIONS FOR SUPPLIERS

The implementation of IUID requirements means that qualifying items shall be marked with machine-readable information (MRI). The Government requiring activity determines an item qualifies for item unique identification if it meets the requirements of DFARS 211.274, Item Identification and Valuation. The Government requiring activity identifies these qualifying items in paragraph (c)(1) of DFARS Clause 252.211-7003. The supplier shall place UII data elements in MRI media on items requiring IUID marking, based on the criteria provided in the latest revision of MIL-STD-130, Identification Marking of U.S. Military Property. The DoD minimum MRI requirement for IUID is the Data Matrix ECC 200 symbol. It is to be applied either through labeling or direct part marking.

The implementation of part marking to uniquely identify items with MRI may require changes in the supplier’s manufacturing and maintenance processes if these processes have not already been enabled to mark items with MRI. If item designs are final and do not enable MRI marking, changes to enable MRI marking shall be incorporated in the engineering drawings and technical data that define the item. Figure 4 illustrates some considerations faced by suppliers in developing a compliant approach to DoD IUID requirements using MRI part marking.

55 For guidelines on engineering and technical documentation changes to support IUID, see the latest version of the Guidelines for Engineering, Manufacturing and Maintenance Documentation Requirements for Item Unique Identification (IUID) Implementation, at http://www.acq.osd.mil/dpap/pdi/uidguides.html.
**Determining Uniqueness of Items**

**Figure 4. Supplier Considerations in Machine-Readable Information Part Marking**

**DECIDING WHEN TO PLACE IUID DATA ELEMENTS ON THE ITEM**

Strategies that produce the greatest business advantage for the items at the lowest cost and in the shortest possible time shall be considered first. The question of when to mark often leads to a conclusion that the probable scenario would be a mixture of *vendor-applied-at-source, opportunity-based, seek-and-apply, and gated strategies*. Requiring vendor-applied-at-source on future contracts for new equipment, major modifications, and reprocurements of end items and spares is important and often the most cost effective for sustainment, but has limited impact on a retrospective application program.

---

Determining Uniqueness of Items

Vendor-Applied-at-Source

Vendor-applied-at-source provides a relatively cheap and unobtrusive application option for future purchases; however, it will not provide the speed of response necessary to successfully implement a retrospective application program for legacy items.

Opportunity-Based Item Application

Opportunity-based, or trigger event, item application can be done in the field or factory, wherever it is convenient to gain access to items either in operational use or available in a storage facility. Projected situations or processes where a trigger event occurs include, but are not limited to:

(a) Change in location where the item is taken out of service at one accountable location and moved to another location to begin service. The item may be marked during this movement process either at the origin or destination, depending on the availability of marking equipment.

(b) Change in status where the item is taken out of service and placed in maintenance or returned to inventory. Maintenance status may include phase maintenance, scheduled servicing, depot rebuild or overhaul processes, and work-order processes during modification. The item shall be marked while in maintenance or upon receipt at the inventory point.

(c) Change in program where the item is shifted from control of one program to another program. The item may be marked by either the losing or gaining program upon the transfer of accountability.

(d) Change in organizational alignment where the item is moved from the custody of one organization to the custody of another organization, such as transfer of Government property from the custodian back to the DoD. The item shall be marked by the organization that is losing custody, unless there is a previous agreement with the receiving organization.

Seek-and-Apply

The seek-and-apply strategy can be used for particular items held within service, either in operational use or in storage. This strategy is dependent on establishing the location and availability of items before deployment of application equipment and teams. The location of items can be determined through the supply chain management information systems and inventory

---

57 This also applies to contractual maintenance arrangements; but it does not apply to normal contractor maintenance and calibration efforts.

58 This does not apply if the item is under control and accountability of the same entity.
Determining Uniqueness of Items

control systems. This approach is dependent upon accurate legacy data, and will demand greater overhead of coordinated effort to obtain access to the assets. By concentrating application efforts, the advantage is faster implementation of configuration management for specific items.

Gated

The interception of items as they transit specific gates within the supply chain (e.g. distribution depot or port of embarkation) can ensure no item enters service without a unique item identifier. Having identified an item at the gate which requires a unique item identifier, the situation can be resolved by either diverting the item back to the sender for application, provision of an application capability at the specific supply gate, or diversion of the item to a centralized application facility.

USE OF THE UNIQUE ITEM IDENTIFIERS IN AUTOMATED INFORMATION SYSTEMS

In the Service or Agency material management and supporting automated information systems (AISs) (developed or maintained in compliance with BEA requirements), once the UII is created from the separate data elements or a UII data set encoded as a single element placed on the item, the UII shall not be parsed to determine the original elements, since parsing and recombination of the elements invariably results in the introduction of errors in the UII; however the UII, the enterprise identifier, the serial number\(^{59}\) and, in the case of Construct #2, the original part number or lot or batch number is captured separately at the time of initial Government receipt and acceptance. The UII shall be a common data element for item traceability in all computational functions including inventory acceptance, item accountability, storage, issue, receipt, valuation, maintenance, and disposal.

The UII shall be used to enable traceability of the item throughout its life within the DoD inventory system, and facilitate item tracking in DoD business systems to provide reliable and accurate data for a variety of purposes that include but are not limited to: program management, property accountability, anti-counterfeiting, reliability analysis, lifecycle management, and serialized item management.

\(^{59}\) It may not be possible to capture a serial number for a UII data set encoded as single element.
ROLES AND RESPONSIBILITIES FOR PROPERTY RECORDS

Property Accountability

DoD Instruction 5000.64\(^{60}\) provides a comprehensive framework for DoD property accountability policies, procedures, and practices; and assists DoD property managers, accounting and financial officers, and other officials in understanding their roles and responsibilities relating to property accountability. It establishes accountability policy for property and equipment; and contains concepts useful for asset management throughout the Department, particularly for property in the possession of individual military units and end-users. Section 6.2 addresses accountability records. It excludes property and materiel for which accountability and inventory control requirements are prescribed in DoD 4140.1-R and DoD 4000.25-2-M\(^{61}\).

DoD Instruction 5000.64 requires that the accountability of property shall be enabled by IUID for identification, tracking, and management. It also requires that the Heads of the DoD Components post changes to the property records for all transactions as required (e.g., loan, loss, damage, disposal, inventory adjustments, item modification, transfer, sale).

Materiel Management of Secondary Items

DoD 4140.1-R contains accountability and inventory control requirements for secondary items in the DoD wholesale supply system. It provides for maintaining official records of inventory to identify the quantities of items on hand, unit prices, locations, physical condition, receipt and issue records, authorized stock numbers, item descriptions and other such information necessary to properly account for materiel and exercise other inventory management responsibilities.

THROUGH-LIFE TRACEABILITY OF UII ITEMS IN THE DoD IUID REGISTRY

The UII shall be connected with authentication data registered in the DoD IUID Registry. The DoD IUID Registry may be accessed by the manufacturer, supplier, distributor, and shipper, as well as the DoD Components' supply chain processes, for receipt and acceptance, inventory

\(^{60}\)It integrates the broad requirements of the Federal Property and Administrative Services Act of 1949, as amended (Act of 30 June 1949, 63 Stat. 372), and the Chief Financial Officers (CFO) Act of 1990 into an overarching property accountability policy. This instruction complements the accounting and financial reporting requirements contained in DoD 7000.14-R.

\(^{61}\)Military Standard Transaction Reporting and Accounting Procedures (MILSTRAP).
management, maintenance, and operations. The DoD Components shall assure that procedures for updating the DoD IUID Registry\textsuperscript{62} to record custodial life cycle events and transfer events are accomplished in accordance with the following guidelines.\textsuperscript{63}

**Obtaining User Access to the DoD IUID Registry**

Authorized Government users shall add items, update and add events to existing items that are registered in the DoD IUID Registry. DoD Components and industry representatives can register for access by following the instructions for the Business Partner Network Support Environment (BPNSE) Registration System (BRS) at https://www.bpn.gov//BRS.

**Life Cycle Events for Mandatory Updating**

**DoD IUID Registry Updating Procedures for Life Cycle Events**

DoD Components and industry representatives shall use the DoD IUID Registry Update function to record an event that happened to a UII item. When an item that is marked with a UII experiences any of the life cycle events listed above, the DoD IUID Registry shall be updated by the DoD Component or industry representative that caused the life cycle event to take place. Once the user gains access, a life cycle event to a UII item shall be updated by entering the UII and then clicking on the Add link next to Life Cycle Event. The Update IUID – Life Cycle Event, page is then displayed. The following fields shall be mandatory:

- Event and Event Date. Enter necessary information in the area that is relevant to the event.

- Life Cycle Event Location shall be used for the location that an event happened, for example, where the UII item was destroyed. Note that one of Commercial and Government Entity (CAGE)
Determining Uniqueness of Items

code, DODAAC or Military Assistance Program Address Code (MAPAC), Dunn and Bradstreet Universal Numbering System (DUNS) number, or Site shall be required for Life Cycle Event Location.

- Life Cycle Event Recipient shall be used when the UII item has changed locations, for example, the UII item has been donated to an organization. The name, country, and one of city or state shall be required when "Organization" is selected as the Life Cycle Event Recipient. One of CAGE, DODAAC or MAPAC, DUNS, or Organization shall be required for the Life Cycle Event Recipient. In addition, if the Life Cycle Event is SOLD-FOREIGN GOVT, then the Recipient Organization Country shall be a required Registry entry.

Updating the DoD IUID Registry for Custodial Transfers of Government Furnished Property

In accordance with the requirements of DoDI 4161.0264, The DoD Components, when issuing Government Furnished Property (GFP) to a contractor, are required to record the transfer of the property in the DoD IUID Registry and its integral GFP module. Contractors, as part of the required receipt of any government property, are required to report to the DoD IUID Registry and its integral GFP module that they have custody of the property, or have returned the property to the government.

Life Cycle Events are not used to report custodial transfers of GFP. When an item moves from government hands to a contractor, or vice versa, a custody record shall be required to indicate the change. This record gives the custodian the access to see the item and perform other update events on that item—for example, part number rollovers or adding marks.

- Once the contractor or government user gains access, a custodian transfer to a GFP item shall be updated by clicking on the GFP Item option on the Add IUID Menu. All GFP/Custody information shall be entered: Custodial Contract Number; Custodial Contract Order Number, Custodial Contract Number Type; one of Commercial and Government Entity (CAGE), Department of Defense Activity Address Code (DoDAAC) or DUNS; Received Date, Category Code, and Status Code are required. Note that for a GFP Item, it is preferable to use a CAGE Code or a DUNS rather than a DoDAAC. IUID data shall be entered: UII Type, UII, and Description are required.

- GFP custody status codes have the following meanings:

---

Determining Uniqueness of Items

- **At Contractor** means that the item is currently in the contractor’s custody under that contract. Note: An item may appear under more than one contract, but it won’t show “At Contractor” for more than one contract at a given time.

- **At Government** means that the contractor is not currently responsible for the item under that contract. It has been returned to the government or transferred to another contract or contractor.

- **A Life-Cycle Event** (ex. SCRAPPED) will show in the status column if the item experienced the event while in contractor custody, and the Life-Cycle Event terminated the custody.

- If the contractor submitted Non-UII data, that information will be available on the Non-UII Results tab.

<td>Unique item identifier data set</td>
<td>A set of one or more data elements marked on an item in machine-readable Data Matrix symbology from which the UII shall be derived. For items that are serialized within the enterprise identifier, the UII data set includes the data elements of enterprise identifier and a unique serial number (Construct #1). For items that are serialized within the part, lot, or batch number within the enterprise identifier, the UII data set includes the data elements of enterprise identifier, the original part number or lot or batch number, and the serial number (Construct #2). In addition to the two constructs composed of multiple data elements, the UII data set may be represented by a UII data set encoded as a single element, such as would be defined by the use of data qualifiers 18S, 25S, USN, UST, or UID, or by a DoD recognized IUID equivalent, such as would be defined by the use of data qualifiers I, 22S, 8002, 8003, or 8004.</td>

WHAT ARE BUSINESS RULES?

A business rule is a statement that defines or constrains some aspect of the business. It is intended to assert business structure or to control or influence the behavior of the business. Typical business rules include definitions of terms, facts relating terms to each other, constraints, and derivations.

IUID BUSINESS RULES

The following section includes the business rules for IUID. The business rules for IUID are divided into the following implementation categories:

- Contracts and Administration
- Unique Item Identifier (UII) Construction and Physical Marking for:
  - Items considered part of a new solicitation after January 1, 2004 (i.e., New Items)
  - Items existing under contract, in operational use, or in inventory (i.e., Legacy Items)
  - Items considered tangible personal property owned by the Government in custody of a contractor after January 1, 2005 (i.e., Property Management Items)

As the IUID implementation has progressed, additions, clarifications and modifications to these business rules have been made.
CONTRACTS AND ADMINISTRATION

1. Within the same Contract Line Item Number (CLIN), there is no need for a contractor to segregate the same items delivered against different Accounting Classification Reference Numbers (ACRN).

2. For FAR Part 12 contracts and subcontracts\(^{71}\):
   - The Government shall mark the item, or
   - The Government shall request the contractor mark the item.

3. Foreign Military Sales (FMS) contracts are not exempt from IUID.

4. Classified and unclassified contracts require IUID.

UII CONSTRUCTION AND PHYSICAL MARKING

Items Considered Part of a New Solicitation

Creating and Generating the Unique Item Identifier

1. The UII shall be derived from its discrete, component data elements or UII data set encoded as single element\(^{72}\). The UII is not required to be marked on the item as a separate data element.

2. If the enterprise chooses to mark the UII data set encoded as single element on the item, any component data elements specified by the contract\(^{73}\) shall also be marked on the item as discrete data elements in addition to the UII encoded into an ECC 200 Data Matrix.

3. Data qualifiers (semantics) shall define each machine-readable data element marked on the item\(^{74}\).

4. If an enterprise serializes items within the enterprise identifier (EID), the UII shall be derived by combining the following data elements, in order\(^{75}\):
   - The issuing agency code (IAC), which shall be derived from the data qualifier for the enterprise identifier if it is not contained within the data element\(^{76}\)

\(^{71}\) Pursuant to the execution of a determination and findings.

\(^{72}\) DI 25S, TEI UID and the DoD recognized IUID equivalents contain the complete UII in a single data element. DI 18S, TEI USN and TEI UST are sufficient to derive the UII from a single data element by adding the IAC prefix for CAGE (D).

\(^{73}\) Configuration management or other purposes may require marking of individual data elements. The contract shall specify the data elements that are required beyond the UII and other MIL-STD-130 requirements.

\(^{74}\) See Appendix D of this Guide for a list of IUID data qualifiers.

\(^{75}\) An encoded data string may contain the component data elements in any order. The ordering of the elements into a valid UII is done after the decoding of the symbol.
• The enterprise identifier, which shall be included as a UII data element in the Data Matrix marked on the item.

• The serial number unique within the enterprise, which shall be included as a UII data element in the Data Matrix marked on the item (Note: This is referred to as UII Construct #1.)

5. If an enterprise serializes items within original part numbers or lot or batch numbers, the UII shall be derived by combining the following data elements, in order:

   • The IAC, which shall be derived from the data qualifier for the enterprise identifier if it is not contained within the data element
   • The enterprise identifier, which shall be included as a UII data element in the Data Matrix marked on the item
   • The original part number or lot or batch number, which shall be included as a UII data element in the Data Matrix marked on the item
   • The serial number unique within original part number or lot or batch number, which shall be included as a UII data element in the Data Matrix marked on the item (Note: This is referred to as UII Construct #2.)

6. The IAC shall be derived from the data qualifier for the enterprise identifier if it is not contained within the data element. The IAC is not required to be separately marked on the item.

7. A specific set of data qualifiers shall allow the automatic identification technology device to determine which UII construct should be used to build the UII or if the UII is already marked on the item.

8. If UII Construct #2 is used, the enterprise shall maintain the data element containing the original part number or lot or batch number on the item for the life of the item. For example, when using TEI UID for a UII Construct #2 (i.e., the original part number or lot or batch number is contained within the data element), the TEI UID data element shall be maintained on the item for the life of the item.

---

76 Enterprise identifiers that are assigned by GS1 contain the IAC prefix. The IAC for the data qualifiers 3V, 18V, 25S, EUC, and UID need not be derived because it is contained in each data element. The IAC shall not be repeated when forming the UII.

77 The enterprise identifier in the UII is the entity that is responsible for compliance with the UII rules. An entity cannot commit another entity to that responsibility without authority. The fundamental principle is: Never use another entity’s enterprise identifier in the UII without permission or direction from the competent authority for that enterprise identifier.

78 An encoded string may contain the component data elements in any order. The ordering of the elements into a valid UII is done after the decoding of the symbol.

79 Original part numbers and lot or batch numbers are mutually exclusive in the UII. In order to avoid ambiguity, only one of those three types of original numbers shall appear in the UII. For serialization within the part number, use only the original part number in the UII. For serialization within the lot or batch number, use only the lot or batch number in the UII.

80 See Table 3 of this Guide for a list of IACs.

81 See Appendix D of this Guide for more details on these data qualifiers.
9. The enterprise is responsible for ensuring that the serial number is unique within the enterprise identifier (for UII Construct #1) or unique within the original part number or lot or batch number (for UII Construct #2).

10. The enterprise is responsible for ensuring that the original part number is not duplicated within the enterprise and that the combination of the original part number and the serial number is unique within the enterprise. If the lot or batch number is used to create the UII then the combination of the lot or batch number and the serial number shall be unique within the enterprise.

11. The UII shall not change over the life of the item. Therefore, the component data elements of the UII shall not change over the life of the item.

12. The enterprise identifier used in the UII identifies the enterprise that assigned the UII to the item. The UII machine-readable code shall not contain more than one enterprise identifier if ambiguity in constructing the UII would result.

13. Data elements not required to construct the UII shall remain discrete but may be contained within the same mark or media as the UII-required elements, provided that (1) all data elements contained in the mark or media are properly identified with a data qualifier, (2) the added data elements do not introduce ambiguity in the concatenation of the UII, and (3) the added data elements do not violate other business rules stated herein. UII data sets encoded as single elements that are sufficient to derive UIIs (i.e., 18S, 25S, UID, UST, USN, and DoD recognized IUID equivalents) shall always be interpreted as the UII regardless of any apparent ambiguity introduced by additional data elements in the symbol. The UII data elements should appear first in the sequence.

14. The UII component data elements or UII data set encoded as single element\(^\text{82}\) and additional data elements shall be contained in a Data Matrix ECC 200 symbol, as required by the latest revision of MIL-STD-130\(^\text{83}\). Data may also be contained in human-readable information and/or other AIT media (e.g., contact memory buttons, linear bar codes, radio frequency identification) in addition to the Data Matrix. The physical marks that contain the UII-required elements shall conform to the permanency and legibility requirements of MIL-STD-130 for the normal life expectancy of the item.

15. Where space is available, human-readable information for UII data elements should be marked on the item. However, if a single element UII (i.e., data qualifiers 18S, 25S, UID, UST, USN, and DoD recognized IUID equivalents) marked on an item includes an item traceability number that is different from an actual serial number that may already be marked on the item, then the traceability number of the single element UII shall not be separately marked on the item in order to avoid having two different serial numbers physically marked on an item. Furthermore, a traceability number used only to create the UII that is not consistent with the item manufacturer's existing serialization may never be encoded in a data matrix using data qualifiers "SER/SEQ" or "S".

\(^{82}\) DI 25S, TEI UID, and the DoD recognized IUID equivalents contain the complete UII in a single data element. DI 18S, TEI USN, and TEI UST are sufficient to derive the UII from a single data element by adding the IAC prefix for CAGE (D).

\(^{83}\) See MIL-STD-130 for additional information on DoD-approved data carriers.
16. The Data Matrix ECC 200 symbol shall utilize DoD-accepted syntax\(^84\).

17. There are identification numbers used in the commercial sector that are DoD recognized IUID equivalents. IUID equivalents shall comply with the IUID Business Rule #14 for minimum data carrier requirements\(^85\).

**Parent-Child Relationships**

18. DFARS 211.274-2(a)(4) requires the item unique identification, regardless of value, of (a) any DoD serially managed subassembly, component, or part embedded within a delivered item and, (b) the parent item (as defined in DFARS 252.211-7003(a)) that contains the embedded subassembly, component or part.

- For purposes of complying with this requirement, the parent item for the embedded item UII or DoD recognized IUID equivalent shall be the next higher replaceable DoD serially managed subassembly, intermediate component, or assembly within the end item that contains the embedded UII.
- In order to provide traceability of the embedded UII to its next higher replaceable assembly level within the end item, the end item shall not be identified as the parent item in instances where a replaceable assembly, intermediate component, or subassembly exists that contains an embedded item UII.

**Metadata Requirements**

19. The UII is a non-parsable field, not to exceed 50 characters in length (excludes overhead characters). Overhead characters in the encoded data string, such as syntax and data qualifiers, are not part of the UII and are eliminated when the UII is constructed. The source protocols for specific data qualifiers may be more restrictive than the allowable field lengths of these rules. Refer to ANS MH10.8.2 for AIs and DIs, and to ATA CSDD for TEIs, for specific limitations on field lengths and usage\(^86\).

- The IAC string of characters shall not exceed 3 characters.
- The enterprise identifier string of characters shall not exceed 13 characters, excluding the data qualifier.
- The original part number or lot or batch number string of characters (including special characters) shall not exceed 32 characters, excluding the data qualifier.

---

\(^85\) See the DoD Guide to Uniquely Identifying Items (Chapter 4) for a list of approved DoD recognized IUID equivalents.

\(^86\) For example, serial number strings are not to exceed 30 characters however TEI SER is limited to 15 characters in accordance with the ATA CSDD.
• The serial number string of characters (including special characters) shall not exceed 30 characters, excluding the data qualifier.\(^{87}\)

• The sum of the maximum number of characters for possible UII data elements is 78, which exceeds the 50 character limit. In order to meet the overall length limitation of 50 characters for the UII, it may be necessary to use field lengths for original part numbers, lot or batch numbers and serial numbers that are shorter than the maximum allowable field lengths for the individual data elements.

20. The UII shall have worldwide uniqueness (non-repeatable).

21. When constructing the UII:

• Any spaces contained in the component data elements shall be deleted.

• All special characters shall be deleted from the enterprise identifier.

• All special characters, except for dashes (-) and forward slashes (/) shall be deleted from the original part number, lot or batch number, and serial number. The deletion of the special characters shall be done when the Data Matrix is decoded to form a UII. The special characters shall be retained within the data elements within the Data Matrix unless the data element within the Data Matrix is a UII data set encoded as single element.

• The UII shall only contain uppercase English alphabet characters A through Z, numeric characters 0 through 9, and the special characters “-” and “/”.\(^{88}\) If the UII data set elements contain lowercase alpha characters, they shall be converted to uppercase before a UII is derived and encoded in the Data Matrix and/or submitted to the IUID Registry. When lowercase alpha characters are encoded in the Data matrix UII data set, they shall be converted by the reader to uppercase alpha characters when the Data Matrix is decoded to form a UII.

**Capturing the Unique Item Identifier**

22. For activities after initial delivery, in support of the product life cycle, any entity that collects data about the item shall be capable of associating the data with the UII in accordance with program requirements.

23. If the UII Data Matrix symbol is unreadable and other AIT media are present, these can be used in a backup mode to derive the UII or query the IUID Registry.

---

\(^{87}\) Leading zeroes in serial numbers are significant characters in the serial number string and in the UII. Avoiding the use of leading zeroes when creating serial numbers may preclude errors in data entry or data processing applications that do not recognize significant leading zeroes.

\(^{88}\) The basic character set for Data Identifiers (MH10.8.2) does not include special characters, unless individually specified for a Data Identifier, or unless the application prescribes an expanded character set. For application in IUID the use of dashes (-) and slashes (/) is permitted in DIs as significant characters for part numbers, lot or batch numbers, and serial numbers, and in DIs that are composed from these numbers (i.e., S, 18S, 25S, 1P, 30P, 1T, and 30T). Dashes and slashes shall not be used as separators between component parts in a single data element that is formed from component parts. Free text formats, if used for additional data, are the responsibility of the user. AIT devices generally support ASCII and extended ASCII for encoding and decoding Data Matrix, while database applications may vary greatly.
If only the human readable data qualifiers and data elements are adjacent to the symbol, the data elements shall be manually input to derive the UII using existing business rules. Prior to derivation of UIIs from backup information the existence of a UII shall be checked by querying the IUID Registry for confirmation of the UII using any identifiable information already marked on the item.

24. Discovery of a duplicate UII shall occur when an attempt is made to register the UII in the IUID Registry. If a true duplicate exists, the Government shall work with the appropriate enterprise(s) to resolve the duplication.

25. Once the UII is derived, it shall not be parsed to determine the original elements.

26. A database containing information on IUID items shall be capable of using the UII or, for a legacy database, the combination of the UII component data elements or other physically marked data associated to the UII in the IUID Registry to retrieve the data record associated with the item represented by the UII.

**Using the Unique Item Identifier**

27. One and only one UII shall be assigned to an item. The UII shall not be transferred from one item to another item once assigned and shall not be reused.

**Items in Operational Use or in Inventory**

*These rules apply in addition to Business Rules #1–#27.*

28. Election to use or not use the existing part number and/or existing serial number as part of the UII for a legacy item is the responsibility of the enterprise assigning the UII89, as is the responsibility for the uniqueness of the resulting UII within its EID.

29. Other than EID, legacy items may use the existing marked data elements in the format of either Construct #1 or #2, or using a DoD recognized IUID equivalent provided that:

- Regardless of enterprise identification in existing marks, the enterprise identifier of the entity that is responsible for assigning the UII and ensuring its uniqueness shall be used.
- The serial number used in the UII complies with Business Rule #9. If the existing serial number is missing or does not ensure uniqueness of the UII, the enterprise shall assign a serial number for the UII that complies with Business Rule #9.
- The original part number or lot or batch number, if it is used in the UII, complies with Business Rule #10. If the original part number or lot or batch number is missing, cannot be determined or does not comply with Business Rule #10, obtain a part, lot, or batch number for the UII from the in-service engineer or other appropriate authority (see Business Rule #30).

---

89 The EID used in marking a legacy item shall be the EID of the entity assigning and registering the UII of the item.
• The original equipment manufacturer (OEM) enterprise identifier and manufacturer assigned serial number, if marked on the item and not a part of the UII, shall be registered in the IUID Registry.

30. If the original part number or lot or batch number cannot be precisely determined, use the following method for establishing an original part number or lot or batch number for the purposes of building the Construct #2 UII:

• First, use the part, lot or batch number at the time of acquisition, if it can be determined.

• Second, use the part, lot or batch number marked on the part at the time the UII is created.

Although this may result in the current part number or lot or batch number being used as the original part number or lot or batch number, the data qualifier for the UII data element shall be the original part number or lot or batch number (i.e., 1P, PNO, 1T, LTN, LOT, or BII). If the lot or batch number is used to create the UII then the combination of the lot number and serial number or batch number and serial number shall be unique within the enterprise. See Business Rule #10.

31. If the item is unidentifiable, a UII should not be assigned.

32. For an on-going contract that is modified to include the IUID requirements:

• If the contract is for delivery of new items to the Government, follow IUID business rules for items considered part of a new solicitation.

• If the contract is for support involving existing inventory items, the program manager shall specify the extent to which IUID business rules for items in operational use or in inventory apply.

Items Considered Tangible Personal Property Owned by the Government in the Custody of a Contractor that Have Not Been Previously Marked

These rules apply in addition to Business Rules #1-#32.

33. A UII shall be created for tangible personal property items owned by the Government in the custody of a contractor by using UII Construct #1, Construct #2, or a DoD recognized IUID equivalent.

34. Tangible personal property items owned by the Government in the custody of a contractor may use the asset identification number used to track the item as the item's serial number within the enterprise identifier of the entity ensuring the uniqueness of the UII.

35. A UII is not required to be physically marked on tangible personal property items owned by the Government in the custody of a contractor unless the item is moved or delivered to a different location with a different enterprise identifier.

---

90 The available information (or information that can be reconstructed) shall be sufficient to identify an item and its essential data, including the part identity and configuration status, and any other factors relevant to the serviceability of the item.
36. Tangible personal property initially furnished to the contractor by the Government shall use the UII provided by the Government. If none is provided, establish a UII using the criteria in Business Rules #33-35.

37. Tangible personal property items owned by the Government in the custody of a contractor also require markings or labels indicating Government ownership.

\[91\text{ For instructions on assignment of virtual UIIs, see the latest version of the } DoD\text{ Guidelines for the Virtual Unique Item Identifier, available at } http://www.acq.osd.mil/dpap/pdi/uid/guides.html.\]
STRUCTURING THE DATA ELEMENTS FOR ITEM UNIQUE IDENTIFICATION

This appendix explains how data elements are correctly structured using semantics and syntax. The concepts of semantics and syntax, which are used to identify and structure data so it can be read by any AIT device, are explained. Examples of current structures in industrial use are presented for American National Standard (ANS) MH10.8.2 Data Identifiers (Tables 9, 10 and 11) and GS1 Application Identifiers (Tables 12 and 13). The historic use of Air Transport Association Common Support Data Dictionary Text Element Identifiers (TEIs) is discussed and examples using TEIs are presented (Tables 14, 15 and 16).

Semantics

For the unique item identifier (UII) data elements to be “machine-readable” by an AIT device, they shall be identified by some means such that the reader device can recognize, through its resident software, what data element it is reading. This is accomplished by employing the concept of “semantics”, which is literally “the meaning of language”. For the purposes of constructing machine-readable data elements, semantics take the form of data qualifiers. These data qualifiers have to define each data element placed on the item. Specific data qualifiers are used to indicate to the AIT devices whether to derive the unique item identifier by using Construct #1, Construct #2, UII data set encoded as single element, or an IUID equivalent. Table 5 shows the different data qualifiers for each of the data elements that are used for determining uniqueness.

---

92 Formerly EAN.UCC.
93 There are three types of data qualifiers being used: Data Identifiers (DIs) (Format Indicator 06), Application Identifiers (AIs) (Format Indicator 05), and, within the aerospace industry, Text Element Identifiers (TEIs) (Format Indicator 12, formerly DD). ISO/IEC International Standard 15418, Information technology–Automatic identification and data capture techniques–GS1 Application Identifiers and ASC MH10 Data Identifiers and maintenance, governs DIs and AIs. Air Transport Association (ATA) Common Support Data Dictionary (CSDD) defines TEIs. ISO/IEC International Standard 15434, Information technology–Automatic identification and data capture techniques–Syntax for high capacity ADC media, contains format indicators for using DIs, AIs and TEIs in syntax encoding.

Table 5. Data Qualifiers for IUID Usage

94 Data Identifier 18V – the concatenation of the issuing agency code (IAC) + enterprise identifier (EID). This Data Identifier would be used for EIDs, which were assigned by an issuing agency, having a registered IAC, that is not listed in this table.

95 MFR – Manufacturer CAGE Code. Identifies the manufacturer, government agency or other organization controlling the design and the part number assignment of the subject part.

96 SPL – Supplier CAGE Code. Identifies the organization creating the UII, where the organization is not the manufacturer, government agency, or other organization controlling the design of the serialized component.
The Mechanics of Item Unique Identification

Syntax

The machine-readable symbology for UII is the Data Matrix ECC 200 (ISO/IEC 16022), which uses Reed-Solomon error correction. The

---

97 SER – Part Serial Number (Serial Number within Enterprise). The SER is the manufacturer’s serialized identity for an individual part, component or component end item.

98 UCN – Unique Component Identification Number. The UCN is the permanent tracking identity assigned to an in-service part by an organization other than the manufacturer, government agency or other organization controlling the design of the subject part and used in lieu of the manufacturer’s serial number.

99 LOT, LTN, and BII. LOT – Lot Number, is a lot number that is not unique within the Enterprise Identifier but is unique within the Original Part Number (PNO). LTN – Enterprise Lot Number, is a lot number that is unique within the Enterprise Identifier. BII – Batch Item Identifier, is a subdivision of an LTN.

100 ESN is a cellular mobile telephone Electronic Serial Number. MEID is the Mobile Equipment Identifier. CMTI is the GS1 Cellular Mobile Telephone Identifier.

101 25S is a Data Identifier defined as the identification of a party to a transaction (as identified by Data Identifier 18V), followed by a supplier assigned serial number (For UII purposes, this has to be unique serialization within the EID that assigns the UII data elements). Thus, for UII purposes, 25S shall represent the following string of elements – IAC + EID + Unique serial number within the EID, which directly corresponds to a UII using serialization within the enterprise.

102 In the case where the EID is the CAGE Code, Data Identifier 18S shall be used. 18S is defined as the concatenation of the CAGE Code (EID) + Unique serial number within the CAGE Code. This data element does not contain the IAC, which shall be added in decoding to form a UII using serialization within the enterprise.

103 DI I identifies a U. S. Vehicle Identification Number (VIN).

104 DI 22S is the Data Identifier for a Unique Individual Identity For Cellular Mobile Telephones – previously designated as an Electronic Serial Number (ESN) and changing to Mobile Equipment Identifier (MEID).

105 AI 8002 is the Application Identifier for a GS1 Cellular Mobile Telephone Identifier (CMTI). The CMTI is up to 20 characters and is an electronic serial identifier of a cellular mobile telephone.

106 AI 8003 identifies a Global Returnable Asset Identifier (GRAI).

107 AI 8004 is the Application Identifier for the Global Individual Asset Identifier (GIAI). The GIAI is up to 30 characters and is a combination of the GS1 Company Prefix and an Individual Asset Reference, which is assigned by the holder of the GS1 Company Prefix. A serialized Global Trade Identification Number (GTIN™) shall also be converted to a GIAI using GS1 procedures.

108 DI 30P current part number is not part of the UII. It is an additional data element that may be encoded in the ISO 15434 syntax in the same Data Matrix along with the UII data elements (see MIL-STD-130). Use 1P when original part number is part of the UII.

109 DI 30T lot/batch number is not part of the UII. It is an additional data element that may be encoded in the ISO 15434 syntax in the same Data Matrix along with the UII data elements (see MIL-STD-130). Use 1T when lot/batch number is part of the UII.

110 DI 49P designates that an item is subject to export control and or restrictions as identified in the Wassenaar Arrangement, see http://www.wassenaar.org/controllists/index.html. The data element is formed by the two-character alpha Country code from ISO 3166-1 which has imposed the export control or restriction, where the Wassenaar code is either the single numeric (1 to 9) category code or the Military List code (an "ML followed by a numeric 1 to 22) that identifies the particular nature of the material that is controlled or restricted. When applicable the code can be suffixed by either an “SL” or a “VSL” to indicate that the item is also on the list of sensitive or very sensitive items. It is an additional data element that may be encoded in the ISO 15434 syntax in the same Data Matrix along with the UII data elements (see MIL-STD-130).

111 Tentative approval has been given to the use of TEI ECI to designate that an item is subject to export control and or restrictions as identified in the Wassenaar Arrangement, See Footnote 152.

symbol is a two-dimensional representation of ASCII characters. To permit translation of the encoded string of ASCII characters, the characters are ordered according to the precise rules of ISO/IEC International Standard 15434, Information Technology—Automatic identification and data capture techniques—Syntax for high capacity ADC media—the “syntax”. Each data string is assembled beginning with a message header consisting of the compliance indicator and a record separator. The compliance indicator is the ASCII code for the three characters [, ), and > which are assembled in that order [,)]. The record separator that follows the compliance indicator is also an ASCII-coded character but it does not have a printable representation. The convention for depicting the record separator uses \texttt{R} and \texttt{G} to represent the single ASCII-coded character. Because the record separator also appears at the end of the formatted data in the data string, it is known as the format trailer character. There are two other ASCII-coded characters that are used in UII encoding that do not have printable representations. They are the data element separator — \texttt{G} —and the message trailer character — \texttt{E}. The hexadecimal and decimal codes for ASCII encoding for \texttt{R}, \texttt{G}, and \texttt{E} can be obtained from ISO/IEC 15434.

The message header is followed by a two-character format indicator to identify the semantics of the formatted data elements. The format indicator, the data qualifiers, and the data values in the remainder of the data string are separated using the data element separator — \texttt{G} —between each element of the formatted data. The formatted data is terminated using the format trailer character — \texttt{R} —after the last data element, and the data string is terminated using the message trailer character — \texttt{E} —to indicate the end.

Once the data elements are identified to the AIT device, the AIT device needs instructions on how to put the data element fields together to define the unique item identifier.

Tables 6, 7 and 8 show how the UII is constructed within Format Indicators 05, 06, and 12 with the various data qualifiers. Conformance to the syntax and semantics requirements is crucial to item unique identification, since the process of encoding, decoding, identifying and forming the data elements shall be unambiguous.

\footnote{\textit{Syntax}—the way words are put together to form constructions, such as phrases and sentences. This standard defines the manner in which the data is transferred to the high capacity ADC media from a supplier’s information system and the manner in which the data is transferred to the recipient’s information system.}

\footnote{The enterprise identifier used in the UII identifies the enterprise that assigned the UII to the item. The UII machine-readable code shall not contain more than one enterprise identifier if ambiguity in constructing the UII would result. Data elements in addition to those required to construct the UII are permitted unless ambiguity in constructing the UII would result. See Business Rules #12 and #13 in Appendix C.}

</tr>
<tr>
<td>CAGE + Serial Number within CAGE (does not contain the IAC)</td>
<td>18S</td>
<td>0CVA5674A36458</td>
<td>18S0CVA5674A36458</td>
</tr>
</tbody>
</table>

Table 9. Examples of the Use of Data Identifiers in Construct #1
Serialization within the Enterprise (Format Indicator 06 of ISO/IEC 15434)

The UII data elements would be encoded as follows using Format Indicator 06 of the ISO/IEC 15434 syntax for Data Identifiers:

\[ \text{|}>R^S_06^G S25SUN077991289674A36458R^E_0T \]

\[ \text{or} \]

\[ \text{|}>R^S_06^G S18S0CVA5674A36458R^E_0T \]

Where:

\[ |> \] = The three-character compliance indicator

\[ R^S \] = A Format Trailer Character which indicates the end of a data format envelope

\[ 06^G \] = A Format Header which indicates Data Identifiers are being used

\[ G^S \] = A Data Element Separator used between data fields

\[ 25S \] = Data Identifier for the complete UII (IAC + Enterprise Identifier + Serial Number)
UN077991289674A36458 = Complete UI—As defined by the Data Identifier 25S (the IAC (UN) and DUNS Enterprise Identifier (077991289) and the Serial Number (674A36458))

18S = Data Identifier for CAGE + Serial Number within CAGE (does not contain the IAC)

0CVA5674A36458 = CAGE + Serial Number within CAGE (does not contain the IAC)—As defined by the Data Identifier 18S (CAGE Enterprise Identifier (0CVA5) and the Serial Number (674A36458))

EoT = A Message Trailer which identifies the end of the message within the data stream

When the AIT device reads the data qualifier for the enterprise identifier, it shall have what agency (that is, the Issuing Agency Code) issued the enterprise identifier available in its software. The AIT device shall then attach the Issuing Agency Code (IAC) to the beginning of the UII concatenation.

When the AIT device reads the data qualifier for 25S, it shall recognize that the data following the 25S is a complete UII for Construct #1, including the IAC. When the AIT device reads the data qualifier for 18S, it shall recognize that the data following the 18S is a CAGE + Serial Number within CAGE (does not contain the IAC) for Construct #1 and shall insert the IAC for CAGE (D) to form the UII.

For these examples using ANS MH10.8.2 Data Identifiers in Format Indicator 06 of ISO/IEC 15434, the UII output from the AIT device, once the overhead and syntax are stripped away, would be UN077991289674A36458 and D0CVA5674A36458 respectively.

Construct #2 – Serialization within the Original Part Number or Lot or Batch Number. Tables 10 and 11 show examples of how the data elements would have to be encoded with Data Identifiers on the AIT media placed on or with the item for UII Construct #2.
Table 10. Example of the Use of Data Identifiers in Construct #2
Serialization within the Original Part Number
(Format Indicator 06 of ISO/IEC 15434)

The UII data elements may be encoded in any order. In this example the UII data elements would be encoded as follows using Format Indicator 06 for Data Identifiers of the ISO/IEC 15434 syntax:

\[ \text{[^])=^{R}^{S}^{06}G_{S}12V077991289G_{S}1P4202435G_{S}S10936^{R}F_{OT} \]

Where:

\[^{R}^{S} \] = The three-character compliance indicator

\[^{R} \] = A Format Trailer Character which indicates the end of a data format envelope

\[^{06} \] = A Format Header which indicates Data Identifiers are being used

\[^{G_{S}} \] = A Data Element Separator used between data fields

\[^{12V} \] = Data Identifier for DUNS Code

\[^{077991289} \] = DUNS Code

\[^{1P} \] = Data Identifier for Part Number assigned by supplier (Original)

\[^{4202435} \] = Original Part Number

\[^{S} \] = Data Identifier for Serial Number

\[^{10936} \] = Serial Number within original part number

\[^{F_{OT}} \] = A Message Trailer which identifies the end of the message within the data stream

When the AIT device reads the data qualifier for the enterprise identifier, it shall have what agency (that is, the Issuing Agency Code) issued the enterprise identifier available in its software. The AIT device shall then attach the Issuing Agency Code (IAC) to the beginning of the UII concatenation. In this example the IAC for Dun & Bradstreet is “UN”.

The UII data elements would be in the order Issuing Agency Code/Enterprise Identifier/Original Part Number/Serial Number. For this example using ANS MH10 Data Identifiers in Format Indicator 06 of ISO/IEC 15434, the UII output from the AIT device, once the overhead and syntax are stripped away and the IAC has been added, would be UN077991289420243510936.

<table>
<thead>
<tr>
<th>Data Element</th>
<th>Data Identifier Format Indicator 06</th>
<th>Data Element Value</th>
<th>Encoded Data Element on AIT Media</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enterprise Identifier • DUNS</td>
<td>12V</td>
<td>077991289</td>
<td>12V077991289</td>
</tr>
<tr>
<td>Lot Number</td>
<td>1T</td>
<td>AA20070230</td>
<td>1TAA20070230</td>
</tr>
<tr>
<td>Serial Number within Lot Number</td>
<td>S</td>
<td>6109</td>
<td>S6109</td>
</tr>
</tbody>
</table>

Table 11. Example of the Use of Data Identifiers in Construct #2
Serialization within the Lot Number
(Format Indicator 06 of ISO/IEC 15434)

If serialization within the lot or batch number is used then the lot or batch number is used in place of the original part number to construct the UII. The UII data elements would be in the order Issuing Agency Code/Enterprise Identifier/Lot or Batch Number/Serial Number. The UII data elements would be encoded as follows using Format Indicator 06 for Data Identifiers of the ISO/IEC 15434 syntax:

\[ \text{[])=} R_s^6G_s12V077991289G_s1TAA20070230G_sS6109R_s^R_o^T \]

Where:

- \text{[])=} The three-character compliance indicator
- \text{R}_s = A Format Trailer Character which indicates the end of a data format envelope
- \text{06} = A Format Header which indicates Data Identifiers are being used
- \text{G}_s = A Data Element Separator used between data fields
- \text{12V} = Data Identifier for DUNS Code
- \text{077991289} = DUNS Code
- \text{1T} = Data Identifier for Lot Number assigned by supplier
AA20070230 = Lot Number  
S = Data Identifier for Serial Number  
6109 = Serial Number within lot number  
\( E_\text{OT} \) = A Message Trailer which identifies the end of the message within the data stream

When the AIT device reads the data qualifier for the enterprise identifier, it shall have what agency (that is, the Issuing Agency Code) issued the enterprise identifier available in its software. The AIT device shall then attach the Issuing Agency Code (IAC) to the beginning of the UII concatenation. In this example the IAC for Dun & Bradstreet is “UN”.

For this example using ANS MH10 Data Identifiers in Format Indicator 06 of ISO/IEC 15434, the UII output from the AIT device, once the overhead and syntax are stripped away and the IAC has been added, would be UN077991289AA200702306109.

Using GS1 Application Identifiers

**Serialization within the Enterprise Identifier.** When using GS1 application identifiers for purposes of item unique identification, enterprises shall use the General GS1 Specifications to construct the DoD recognized IUID equivalent or the UII data elements. Serialization within the enterprise identifier requires the use of a DoD recognized IUID equivalent.

**Serialization within the Global Trade Item Number (GTIN).** When using the GS1 System for serialization within a GTIN and enterprise, the serial number shall be incorporated into the Individual Asset Reference component of the GIAI that is described in Table 13 below. The GTIN is the 14-character identifier which uniquely identifies the company (enterprise) and its product (part number). When properly associated with a serial number, a globally unique item identifier can be created. The Individual Asset Reference component element containing the GTIN and serial number is constructed as described in the GS1 published Guidelines for Department of Defense Unique Identification (UID) Markings Using the GS1 System.

Table 12 shows an example of the use of Application Identifiers in the context of the General GS1 Specifications for a GIAI using the Individual Asset Reference Number.

---

118 Formerly EAN.UCC.  
119 See [http://www.uc-council.org/ean_ucc_system/index.cfm](http://www.uc-council.org/ean_ucc_system/index.cfm) for information about the GS1 System (formerly EAN.UCC System) and GS1 documents.
Table 12. Example of the Use of Application Identifiers for GIAI using the Individual Asset Reference Number (Format Indicator 05 of ISO/IEC 15434)

For item unique identification, the Global Individual Asset Identifier (GIAI) is considered by the DoD to be an IUID equivalent. The data elements considered components of the IUID equivalent (i.e., GS1 Company Prefix, Individual Asset Reference Number) are not required to be marked on the item, unless specifically required by the contract.

Using the General GS1 Specifications, the minimum DoD IUID equivalent data elements would be encoded as follows under Format Indicator 05 of the ISO/IEC 15434 syntax for Application Identifiers:

\[ (>R_S05G_S800406141411A0B9C3D6 R_S E_oT \]

Where:
\[ > \]= The three-character compliance indicator
\[ R_S \]= A Format Trailer Character which indicates the end of a data format envelope
\[ 05 \]= A Format Header which indicates Application Identifiers are being used
\[ G_S \]= A Data Element Separator used between data fields
\[ 8004 \]= Application Identifier for Global Individual Asset Identifier (GIAI)
\[ 06141411A0B9C3D6 \]= GIAI, which is composed of the GS1 Company Prefix including the IAC as the leading character (0614141) and the Individual Asset Reference Number (1A0B9C3D6)

---

120 Within the General GS1 Specifications, the Global Individual Asset Identifier (GIAI) is considered a DoD recognized IUID equivalent. The Application Identifier (8004) indicates that the data field contains a GIAI. The GIAI is made up of the GS1 Company Prefix and an individual asset reference number. The holder of the GS1 Company Prefix determines the structure and numbering of the individual asset reference number.

121 A DoD recognized IUID equivalent means an item unique identification method that is in commercial use and has been recognized by DoD.

122 This is an exception to IUID Business Rule #2. See Appendix C. If the contract requires marking IAW MIL-STD-130, the enterprise ID shall be included in the Data Matrix as a separate data element as well as the part number.
EOT = A Message Trailer which identifies the end of the message within the data stream

For this example using Application Identifiers in Format Indicator 05 of ISO/IEC 15434, the DoD IUID equivalent output from the AIT device, using the GIAI as the IUID equivalent, stripping away the overhead and syntax, would be 06141411A0B9C3D6123.

**IUID Equivalent – Global Individual Asset Identifier (GIAI) using the Serialized Global Trade Item Number (GTIN™).** Table 11 shows an example of the use of Application Identifiers in the context of the General GS1 Specifications for a GIAI using the Serialized GTIN™. The Application Identifier 8004 is also used for this construct but the composition of the data element value shall be derived from the Global Trade Item Number (GTIN™) and a serial number. The General GS1 Specifications provide information on the GTIN™ and the method for creating the GIAI is described in the Guidelines for Department of Defense Unique Identification Markings Using the GS1 System124. In this construct, the GTIN™ is the 14-character identifier which uniquely identifies the company (enterprise) and its product (part number). When properly associated with a serial number, a globally unique item identifier can be created.

<table>
<thead>
<tr>
<th>Data Element</th>
<th>Application Identifier Format Indicator 05</th>

<td>8004061414100332411A0B9C3D6</td>
</tr>
</tbody>
</table>

Table 13. Example of the Use of Application Identifiers for GIAI using the Serialized GTIN™ (Format Indicator 05 of ISO/IEC 15434)

Using the General GS1 Specifications, the minimum UII data elements would be encoded as follows under Format Indicator 05 of the ISO/IEC 15434 syntax for Application Identifiers:

\[ \text{Data Stream} \] \text{EOT} \]

123 Since the IAC is the first digit of the Company Prefix, it is not necessary to add it in forming the UII.

124 See [http://www.uc-council.org/ean_ucc_system/index.cfm](http://www.uc-council.org/ean_ucc_system/index.cfm) for information about the GS1 System (formerly EAN.UCC System) and GS1 documents.

125 Within the General GS1 Specifications, the Global Individual Asset Identifier (GIAI) is considered a DoD recognized UIID equivalent. The Application Identifier (8004) indicates that the data field contains a GIAI. The GIAI is made up of the GS1 Company Prefix and an individual asset reference number. The holder of the GS1 Company Prefix determines the structure and numbering of the individual asset reference number.
Where:

[]>= The Message Header consisting of a three-character compliance indicator and the Format Trailer Character Rs to indicate the end of a data format envelope

Rs = A Format Trailer Character which indicates the end of a data format envelope

05 = A Format Header which indicates Application Identifiers are being used

Gs = A Data Element Separator used between data fields

8004 = Application Identifier for Global Individual Asset Identifier (GIAI)

061414100332411A0B9C3D6 = GIAI, which is derived by a two-step method of modifying the GTIN™ (10614141003324) to create a new data element (06141410033241) and concatenating a serial number (1A0B9C3D6) with the new data element.

EoT = A Message Trailer which identifies the end of the message within the data stream

For this example using Application Identifiers in Format Indicator 05 of ISO/IEC 15434, the UII output from the AIT device, stripping away the overhead and syntax would be 061414100332411A0B9C3D6

Historic Use of Text Element Identifiers

Text Element Identifiers (TEIs) are the preferred approach of the aerospace industry. The aerospace industry uses CAGE Code (TEI = MFR) to identify the manufacturer with serial number (TEI = SER) to provide unique identity of the item. The aerospace industry philosophy is no duplication of serial numbers within an enterprise, regardless of the product, so that a simple combination of enterprise identifier and serial number provides item unique identification of that item forever. As revisions are implemented that change the form, fit or function of the part, the aerospace industry changes the part number (TEI = PNR) to reflect those changes. This is called “rolling the part number.”

As aerospace moved TEIs into broader multi-industry use, they determined a need to establish additional TEIs for DUNS Number (TEI = DUN), UCC Company Prefix (TEI = EUC), Serial Number within Part Number (TEI = SEQ), Original Part Number (TEI = PNO), and UII (TEI

---

126 The new data element is created by moving the first character of the GTIN™ to the last position of the GTIN™.
127 Since the IAC is the first digit of the Company Prefix, it is not necessary to add it in forming the UII.
128 All TEIs are four characters in length, consisting of three uppercase letters followed by a space.
129 CAGE Code is also indicated by TEI = CAG. An enterprise identified by CAG need not be the manufacturer.
The Mechanics of Item Unique Identification

= UID ) to encode Text Element Identifiers other than Manufacturer (TEI = MFR ), Serial Number (TEI = SER ) and Current Part Number (TEI = PNR )\textsuperscript{130}. It was also determined that they needed a separator that would not be used within data, as opposed to the “/” used in ATA SPEC2000, Chapter 9. Finally, it was determined that an unambiguous header/trailer was needed to identify that the data fields represented were in Text Element Identifier form.

The needed non-data separator and unambiguous header/trailer were available in ISO/IEC 15434, Information Technology--Automatic identification and data capture techniques--Syntax for high capacity ADC media, and this gave rise to the Collaborative Solution.

The Collaborative AIT Solution

The DoD has approved the use of ISO/IEC 15418 and ISO/IEC 15434 in its acquisitions. The collaborative solution was established to enable the use of Text Element Identifiers (TEIs) selected from the ATA CSDD using the syntax of ISO/IEC 15434 until such time as the International Organization for Standardization could consider a new format indicator in ISO/IEC 15434 to support TEIs. In the interim DoD recognized “DD” as the format indicator for TEIs thereby permitting use of ISO/IEC 15434 as the IUID syntax standard\textsuperscript{131}. DoD also recognized selected TEIs for IUID usage from the ATA Common Support Data Dictionary (CSDD) and new TEIs that were proposed to support IUID. In addition, in support of the collaborative solution, the Air Transport Association (ATA) Spec 2000 International Coordinating Group approved the use of ISO/IEC 15434 syntax with TEIs as an alternative item marking method.

Since that time the International Organization for Standardization has added a new format indicator, “12”, in ISO/IEC 15434 to support TEIs. The new format indicator “12” has replaced the interim format indicator “DD” previously prescribed in this guidance. Items that have been marked with the format indicator “DD” do not have to be re-marked but further use of “DD” is not permitted. Also, the TEIs that were proposed for IUID usage have been approved and incorporated into the ATA CSDD by the Air Transport Association.

\textsuperscript{130} On October 26, 2004, the Air Transport Association (ATA) Spec2000 Coordinating Group approved the following Text Element Identifiers (TEIs) for usage: PNO (Original Part Number), SEQ (Serial Number) within Original Part Number) and UID (Unique Item Identifier). The PNO and SEQ TEIs will allow for the use of UII Construct 2 (i.e., serialization within original part number).

\textsuperscript{131} ISO/IEC 15434, Information Technology--Automatic identification and data capture techniques--Syntax for high capacity ADC media, specifies a two-digit format indicator. All two-digit numbers (00-99) are assigned or reserved for future use. This means that a format indicator for Text Element Identifiers of the collaborative solution could not be assigned a two-digit number without ISO approval. To enable the collaborative solution utilizing the ISO/IEC 15434 syntax, the Department specified a special DoD-specific format indicator, designated as “DD”, to indicate TEIs were being used in the collaborative solution.
Using Text Element Identifiers

Construct #1 – Serialization within the Enterprise Identifier by Manufacturer. Table 16 shows an example of the use of TEIs for UII Construct #1 when the manufacturer serializes the item.

<table>
<thead>
<tr>
<th>Data Element</th>

</tr>
<tr>
<td>• CAGE</td>
<td>MFR</td>
<td>0CVA5</td>
<td>MFR 0CVA5</td>
</tr>
<tr>
<td>Serial Number within Enterprise Identifier</td>
<td>SER</td>
<td>674A36458</td>
<td>SER 674A36458</td>
</tr>
</tbody>
</table>

Table 14. Example of the Use of TEIs for UII Construct #1, Manufacturer Serialization (Format Indicator 12 of ISO/IEC 15434)

The UII data elements may be encoded in any order. In this example the UII data elements would be encoded as follows using Format Indicator 12 for TEIs utilizing the ISO/IEC 15434 syntax:

\[ > R_s 12 G_s MFR 0CVA5 G_s SER 674A36458 R_s E_o T \]

Where:
\[ > \] = The three-character compliance indicator
\[ R_s \] = A Format Trailer Character which indicates the end of a data format envelope
\[ 12 \] = A Format Header which indicates Text Element Identifiers are being used
\[ G_s \] = A Data Element Separator used between data fields
\[ MFR \] = TEI for Manufacturer CAGE code
\[ 0CVA5 \] = CAGE Code
\[ SER \] = TEI for Serial Number within the Enterprise Identifier
\[ 674A36458 \] = Serial Number within Enterprise Identifier
\[ E_o T \] = A Message Trailer which identifies the end of the message within the data stream

\(^{132}\) All TEIs are four characters in length, consisting of three letters followed by a space.
When the AIT device reads the data qualifier for the enterprise identifier, it shall have what agency (that is, the Issuing Agency Code) issued the enterprise identifier available in its software. The AIT device shall then attach the Issuing Agency Code (IAC) to the beginning of the UII concatenation. In this example the IAC for CAGE is “D”.

The UII data elements would be in the order Issuing Agency Code/Enterprise Identifier/Serial Number. For this example using Format Indicator 12 for TEIs in the ISO/IEC 15434 syntax, the UII output from the AIT device, once the overhead and syntax are stripped away and the IAC has been added, would be D0CVA5674A36458.

**Construct #1 – Serialization within the Enterprise by an Organization other than the Manufacturer.** Table 17 shows an example of the use of TEIs for UII Construct #1 when serialization is done by an organization other than the manufacturer of the item.

<table>
<thead>
<tr>
<th>Data Element</th>
<th>TEI 133</th>
<th>Data Element Value</th>
<th>Encoded Data Element on AIT Media</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enterprise Identifier</td>
<td>SPL</td>
<td>0F3N5</td>
<td>SPL 0F3N5</td>
</tr>
<tr>
<td>Serial Number within Enterprise Identifier, other than Manufacturer</td>
<td>UCN</td>
<td>10936</td>
<td>UCN 10936</td>
</tr>
</tbody>
</table>

**Table 15. Example of the Use of TEIs for UII Construct #1, Enterprise other than Manufacturer (Format Indicator 12 of ISO/IEC 15434)**

The UII data elements may be encoded in any order. In this example the UII data elements would be encoded as follows using Format Indicator 12 for TEIs utilizing the ISO/IEC 15434 syntax:

\[
]>^R_s12^G_sSPL \ 0F3N5^G_sUCN \ 10936^R_E^F_T
\]

Where:

\( >^R_s \) = The three-character compliance indicator

\( ^R_s \) = A Format Trailer Character which indicates the end of a data format envelope

\( 12 \) = A Format Header which indicates Text Element Identifiers are being used

\( ^G_s \) = A Data Element Separator used between data fields

133 All TEIs are four characters in length, consisting of three uppercase letters followed by a space.

75
**SPL** = TEI for CAGE code, Enterprise other than Manufacturer

**0F3N5** = CAGE Code

**UCN** = TEI for Unique Component Number assigned by Enterprise other than the Manufacturer

**10936** = Unique Component Number

**EO** = A Message Trailer which identifies the end of the message within the data stream

When the AIT device reads the data qualifier for the enterprise identifier, it shall have what agency (that is, the Issuing Agency Code) issued the enterprise identifier available in its software. The AIT device shall then attach the Issuing Agency Code (IAC) to the beginning of the UII concatenation. In this example the IAC for CAGE is “D”.

The UII data elements would be in the order Issuing Agency Code/Enterprise Identifier/Serial Number. For this example using Format Indicator 12 for TEIs in the ISO/IEC 15434 syntax, the UII output from the AIT device, once the overhead and syntax are stripped away and the IAC has been added, would be **D0F3N510936**.

**Construct #2 – Serialization within the Original Part Number or Lot or Batch Number.** Table 18 shows an example of the use of TEIs for UII Construct #2 when the manufacturer serializes the item within the original part number, PNO.

<table>
<thead>
<tr>
<th>Data Element</th>
<th>TEIs135</th>
<th>Data Element Value</th>
<th>Encoded Data Element on AIT Media</th>

<td>0CVA5</td>
<td>CAG 0CVA5</td>
</tr>
<tr>
<td>Original Part Number</td>
<td>PNO</td>
<td>4202435</td>
<td>PNO 4202435</td>
</tr>
<tr>
<td>Serial Number within</td>
<td>SEQ</td>
<td>674A36458</td>
<td>SEQ 674A36458</td>
</tr>
<tr>
<td>Original Part Number</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Table 16. Example of the Use of TEIs for UII Construct #2, Serialization within the Original Part Number (Format Indicator 12 of ISO/IEC 15434)

---

134 An enterprise that serializes within lot or batch number would use LOT, LTN, or BII, as appropriate, in place of PNO.
135 All TEIs are four characters in length, consisting of three uppercase letters followed by a space.
136 The TEI of MFR may also be used to designate the manufacturer.
The Mechanics of Item Unique Identification

The UII data elements may be encoded in any order. In this example the UII data elements would be encoded as follows using Format Indicator 12 for TEIs utilizing the ISO/IEC 15434 syntax:

\[ \text{[}>\text{R}_s\text{12}_s\text{CAG 0CVA5}_s\text{PNO 4202435}_s\text{SEQ 674A36458}_s\text{E}_o\text{T} \]

Where:

\[ \text{[}> = \text{The three-character compliance indicator} \]
\[ \text{R}_s = \text{A Format Trailer Character which indicates the end of a data format envelope} \]
\[ \text{12}_s = \text{A Format Header which indicates Text Element Identifiers are being used} \]
\[ \text{G}_s = \text{A Data Element Separator used between data fields} \]
\[ \text{CAG} = \text{TEI for Manufacturer CAGE code} \]
\[ \text{0CVA5} = \text{CAGE Code} \]
\[ \text{PNO} = \text{TEI for Original Part Number} \]
\[ \text{4202435} = \text{Original Part Number} \]
\[ \text{SEQ} = \text{TEI for Serial Number within the Original Part Number} \]
\[ \text{674A36458} = \text{Serial Number within the Original Part Number} \]
\[ \text{E}_o\text{T} = \text{A Message Trailer which identifies the end of the message within the data stream} \]

When the AIT device reads the data qualifier for the enterprise identifier, it shall have what agency (that is, the Issuing Agency Code) issued the enterprise identifier available in its software. The AIT device shall then attach the Issuing Agency Code (IAC) to the beginning of the UII concatenation. In this example the IAC for CAGE is “D”.

The UII data elements would be in the order Issuing Agency Code/Enterprise Identifier/Original Part Number/Serial Number. For this example using Format Indicator 12 for TEIs in the ISO/IEC 15434 syntax, the UII output from the AIT device, once the overhead and syntax are stripped away and the IAC has been added, would be \text{D0CVA54202435674A36458}.
